THE RESPIRATORY SYSTEM

FIRST VIDEO: THE RESPIRATORY SYSTEM (EducationWithVision)

Humans breathe in oxygen and breathe out carbon dioxide; a process known as respiration. The respiratory system includes the nose, throat, voice box, windpipe, and lungs. At the top of the respiratory system, the nostrils bring air into the nasal cavity where it's filtered, warmed and moistened.

The windpipe divides into two branches, called bronchi, and each one of these enters one of the two lungs of the body. Each branch resembles the limbs of a tree dividing into smaller, finer branches called bronchioles. These end in tiny air sacs called alveoli.

What are alveoli?

Tiny structures that enable fresh air to get to the air sacs, which are surrounded by tiny blood vessels, or capillaries. The oxygen passes through these air sacs and travels through the capillary walls into the bloodstream. At the same time, carbon dioxide transfers from the bloodstream into the air sacs where it gets breathed out of the body.

What are cilia?

Cilia are tiny hairs that protect the nasal passageways and filter out dust and other particles that enter the nose through the breathed air.

What is the trachea?

A 2-3cm tube that extends downwards from the bottom of the larynx for about 12cm, it is made strong by stiff rings of cartilage. It is lined with tiny hairs that sweep out foreign particles and fluids.

What is the pharynx?

The pharynx is where the two airways of the nose and mouth meet up. It carries both food and air.

What is the larynx? Where is it located?

The larynx is where our vocal cords are, and is located at the top of the trachea

Study tips in the preface provide insights on the most effective methods for learning and retaining information. Answers to exercises in the back of the book include references to the appropriate textbook page to give readers instant feedback. NEW! Updated art throughout enhances learning by presenting anatomy even more clearly.

Evolutionary Physiology and Biochemistry Multiple authors, 2018-02-19. In 2016 it was 60 years since the eminent Soviet researcher, a disciple and a successor of Ivan Pavlov, Leon Orbeli, had proclaimed the birth of a new branch of physiology: evolutionary physiology. In the same year, his ideas were

embodied in the foundation in Leningrad now Saint Petersburg of the present Sechenov Institute of Evolutionary Physiology and Biochemistry of the Russian Academy of Sciences This anniversary book includes the selected works carried out recently by his followers at the same institute While addressing some hot aspects of evolutionary physiology and biochemistry they demonstrate that this branch of physiology really represents a discipline in its own right
