

## TEMPLATE ANSWERS: PLANT HORMONES

**Describe how phototropism occurs in stems to get them to bend towards light.**

- Auxins  $\therefore$  are sensitive to light  $\therefore$
- Light stimulus from one side  $\therefore$  (unilateral light)
- causes auxins to move to the shaded side  $\therefore$  / destroyed on the illuminated side
- Auxin concentration is higher  $\therefore$  on the shaded side  $\therefore$
- This promotes cell elongation  $\therefore$  on the shaded side of the plant
- Resulting in more growth  $\therefore$  than this side
- The stem grows towards  $\therefore$  the light stimulus
- This is called phototropism  $\therefore$

**Describe how a stem placed horizontally forms to grow upwards (Negative Geotropism: Shoots)**

- Auxins will accumulate on the lower side  $\therefore$  of the stem
- As they are attracted by gravity  $\therefore$
- And inhibit  $\therefore$  cell elongation  $\therefore$  on the lower side  $\therefore$
- While the upper side grows slowly  $\therefore$
- Causing the stem to grow upward  $\therefore$
- Away from gravity  $\therefore$

*Note: This movement is not about light. Any time the stem is laid horizontally it's going up for about gravity*

**Describe how a root placed horizontally forms to grow downwards (Positive Geotropism: Roots)**

- Auxins will accumulate on the lower side  $\therefore$  of the root
- As they are attracted by gravity  $\therefore$
- And inhibit  $\therefore$  cell elongation  $\therefore$  on the lower side  $\therefore$
- While the upper side grows faster
- Causing the root to grow downward  $\therefore$
- Towards gravity  $\therefore$

**Name the functions of Auxins.**

- Responsible for photo- and gravitropism
- Promote cell division
- Promote cell enlargement
- Responsible for apical dominance
- by inhibiting lateral branch growth
- and promoting growth in the apical bud
- Promotes root development

*Annual Plant Reviews, Biology of the Plant Cuticle* Markus Riederer, Caroline Muller, 2008-04-15 Annual Plant Reviews Volume 23 A much clearer picture is now emerging of the fine structure of the plant cuticle and its surface the composition of cuticular waxes and the biosynthetic pathways leading to them Studies assessing the impact of UV radiation on plant life have emphasized the role of the cuticle and underlying epidermis as optical filters for solar radiation The field concerned with the diffusive transport of lipophilic organic non

electrolytes across the plant cuticle has reached a state of maturity A new paradigm has recently been proposed for the diffusion of polar compounds and water across the cuticle In the context of plant ecophysiology cuticular transpiration can now be placed in the perspective of whole leaf water relations New and unexpected roles have been assigned to the cuticle in plant development and pollen stigma interactions Finally much progress has been made in understanding the cuticle as a specific and extraordinary substrate for the interactions of the plant with microorganisms fungi and insects This volume details the major developments of recent years in this important interdisciplinary area It is directed at researchers and professionals in plant biochemistry plant physiology plant ecology phytopathology and environmental microbiology in both the academic and industrial sectors

**Plant Hormones** P.J. Davies, 2013-12-01 Plant hormones play a crucial role in controlling the way in which plants grow and develop While metabolism provides the power and building blocks for plant life it is the hormones that regulate the speed of growth of the individual parts and integrate these parts to produce the form that we recognize as a plant In addition they play a controlling role in the processes of reproduction This book is a description of these natural chemicals how they are synthesized and metabolized how they work what we know of their molecular biology how we measure them and a description of some of the roles they play in regulating plant growth and development Emphasis has also been placed on the new findings on plant hormones deriving from the expanding use of molecular biology as a tool to understand these fascinating regulatory molecules Even at the present time when the role of genes in regulating all aspects of growth and development is considered of prime importance it is still clear that the path of development is nonetheless very much under hormonal control either via changes in hormone levels in response to changes in gene transcription or with the hormones themselves as regulators of gene transcription This is not a conference proceedings but a selected collection of newly written integrated illustrated reviews describing our knowledge of plant hormones and the experimental work that is the foundation of this knowledge
