Ulrich Häußler-Combe,2014-11-24 The book covers the application of numerical methods to reinforced concrete structures To analyze reinforced concrete structures linear elastic theories are inadequate because of cracking bond and the nonlinear and time dependent behavior of both concrete and reinforcement These effects have to be considered for a realistic assessment of the behavior of reinforced concrete structures with respect to ultimate limit states and serviceability limit states The book gives a compact review of finite element and other numerical methods The key to these methods is through a proper description of material behavior Thus the book summarizes the essential material properties of concrete and reinforcement and their interaction through bond These basics are applied to different structural types such as bars beams strut and tie models plates slabs and shells This includes prestressing of structures cracking nonlinear stressstrain relations creeping shrinkage and temperature changes Appropriate methods are developed for each structural type Large displacement and dynamic problems are treated as well as short term quasi static problems and long term transient problems like creep and shrinkage Most problems are illustrated by examples which are solved by the program package ConFem based on the freely available Python programming language The ConFem source code together with the problem data is available under open source rules at concrete.fem.com The author aims to demonstrate the potential and the limitations of numerical methods for simulation of reinforced concrete structures addressing students teachers researchers and designing and checking engineers *Non-Linear Mechanics of Reinforced Concrete* K. Engineering Materials, Structures, Systems and Methods for a More Sustainable Future Alphose Zingoni, 2025-08-20 Engineering Materials Structures Systems and Methods for a More Sustainable Future comprises 275 papers that were presented at SEMC 2025 the Ninth International Conference on Structural Engineering Mechanics and Computation This event held in Cape Town South Africa from 1 to 3 September 2025 was attended by around 300 participants from 42 countries worldwide

The Proceedings are divided into 15 sections. The various topics may be grouped into five broad categories covering i the mechanics of materials, solids and structures; ii numerical modelling, computational simulations and experimental testing; iii analysis, design and construction in the traditional engineering materials; iv innovative engineering materials, structures and methods; v maintenance, long term performance, life cycle considerations and sustainable construction. Engineering Materials, Structures, Systems and Methods for a More Sustainable Future will be of interest to civil, structural, mechanical, marine and aerospace engineers as well as planners and architects. Two versions of the papers are available: full papers of length six pages are included in the e-book while short papers of length two pages, intended to be concise but self-contained summaries of the full papers, are in the printed book.

Flax-TRM Composite Systems for Strengthening of Masonry Giuseppe Ferrara, 2021-03-26. This book is intended to raise awareness about the use of sustainable Textile Reinforced Mortar (TRM) composite systems including plant fibers for civil engineering applications. It presents a comprehensive characterization of the mechanical properties of Flax-TRM composite systems when used for strengthening masonry elements. Moreover, it reports on a physical and mechanical characterization of the single components such as the textile and mortar. In turn, it describes tensile tests on the composite and shear bond tests on Flax-TRM to masonry substrate elements carried out for the purpose of analyzing the composite material and its adherence behavior with a brick masonry element. It also reports on the analysis of the contribution of the reinforcement system on the shear capacity of masonry elements carried out via diagonal compression tests. Last but not least, the book reports on some innovative solutions for improving the mechanical performance of the reinforcement system, e.g. by treating the fiber or modifying the matrix mix design, discussing the experimental findings in detail. All in all, this book offers extensive information on the use of plant fibers as reinforcement in TRM systems, specifically highlighting the potential of this composite as a strengthening strategy for various civil engineering applications. Moreover, it defines key mechanical aspects of the composite that must be taken into consideration for increasing the efficiency of the reinforcing system. Last but not least, the book describes some technical solutions aimed at an overall improvement of the structural performance of sustainable textile reinforced composite.
