

Transpiration

← = MOVEMENT OF WATER

Transpiration Pull

- Transpiration pull occurs from the evaporation of water from mesophyll cells.
 - 1. The water molecules in the air spaces between the cells pull the water column in the xylem vessels.
 - 2. This causes transpiration pull to happen rapidly within the water column.
- Water molecules are attracted to each other by cohesion, creating a continuous column of water up the plant.

- Water moves through the xylem vessels in a continuous transpiration stream from roots to leaves via the stem.
 - Transpiration creates a negative pressure in the xylem, pulling the water up the stem towards the leaves.
 - The water molecules are held together by cohesion between water molecules, creating a continuous column of water up the stem.
 - At the top of the transpiration stream, the water molecules are pulled up the stem towards the leaves.
