right sextant there was an average of 6 1 6 1 6 8 3 6 and 2 6 3 0 among sites in Groups 1 2 and 3 respectively The maxillary anterior sextant averaged 26 1 7 6 6 4 4 4 and 1 2 1 9 among sites Groups 1 2 and 3 respectively The upper left sextant had an average of 12 6 7 1 4 9 3 3 and 2 1 2 7 for Groups 1 2 and 3 respectively The lower right sextant had an average of 12 7 4 3 7 4 3 5 and 2 6 2 7 for Groups 1 2 and 3 respectively The mandibular anterior sextant had an average of 28 7 7 1 5 8 5 6 and 1 0 2 2 among sites in Groups 1 2 and 3 respectively Finally the lower left sextant averaged 11 2 4 9 9 1 4 6 and 1 7 2 2 among sites in Groups 1 2 and 3 respectively Conclusions Oral health should seek to adopt a wellness model that considers a balance of mind mouth and well being that affords a patient the right to honor their autonomy in evaluating their personal perceptions of wellness This preliminary report sought to explore the feasibility of adopting the modified wellness model introduced by Mariotti and Hefty This model focuses on four principal characteristics to assess periodontal health 1 a functional dentition 2 painless function 3 stability of the periodontal attachment apparatus and 4 the psychological and social well being of the individual By gathering long term clinical data and patient questionnaires it is the aim of this longitudinal study to eventually establish ways in which to adopt this paradigm into practice Future studies are required to evaluate the practicality and reliability of this model and its proper utilization in clinical decision making and patient management It is the author s hope that this model of health and wellness can evolve and be a more universally accepted way to define periodontal health

Utilizing Electronic Dental Record Data to Track Periodontal Disease Change Jay Sureshbhai Patel, 2020 Periodontal disease PD affects 42% of US population resulting in compromised quality of life the potential for tooth loss and influence on overall health Despite significant understanding of PD etiology limited longitudinal studies have investigated PD change in response to various treatments A major barrier is the difficulty of conducting randomized controlled trials with adequate numbers of patients over a longer time Electronic dental record EDR data offer the opportunity to study outcomes following various periodontal treatments However using EDR data for research has challenges including quality and missing data In this dissertation I studied a cohort of patients with PD from EDR to monitor their disease status over time I studied retrospectively 28 908 patients who received comprehensive oral evaluation at the Indiana University School of Dentistry between January 1st 2009 and December 31st 2014 Using natural language processing and automated approaches we 1 determined PD diagnoses from periodontal charting based on case definitions for surveillance studies 2 extracted clinician recorded diagnoses from clinical notes 3 determined the number of patients with disease improvement or progression over time from EDR data We found 100% completeness for age sex 72% for race 80% for periodontal charting findings and 47% for clinician recorded diagnoses The number of visits ranged from 1 14 with an average of two visits From diagnoses obtained from findings 37% of patients had gingivitis 55% had moderate periodontitis and 28% had severe periodontitis In clinician recorded diagnoses 50% patients had gingivitis 18% had mild 14% had moderate and 4% had severe periodontitis The concordance between periodontal charting generated and clinician recorded diagnoses was 47% The results indicate

that case definitions for PD are underestimating gingivitis and overestimating the prevalence of periodontitis Expert review of findings identified clinicians relying on visual assessment and radiographic findings in addition to the case definition criteria to document PD diagnosis *Chart Book* Daly Racing Form,1958 **Foundations of Periodontics for the Dental Hygienist** Jill Shiffer Gehrig,2015-06
