

## UNIT 6 AND UNIT 10

### STUDY GUIDE – Answer Key

1. Ecological succession and equilibrium share a relationship in the environment, what is it?  
*Succession helps to maintain equilibrium in an ecosystem*
2. What is the main contributing factor to an ecosystem's sustainability?  
*Increase in biodiversity*
3. What is the role of a pioneer species in primary succession?  
*Change bare habitat into one that is suitable for other organisms*
4. A species that is responsible for primary success in an ecosystem is most likely able to do what?  
*Photosynthesis*
5. Create a sequence that most likely represents succession on a recently abandoned corn field:  
*Grasses – flowering plants – shrub – native trees*
6. Complete this statement: the more divers an ecosystem is:  
*The more stable it is*
7. In an area where there was a forest fire, which organism would most like appear first in secondary succession?  
*Grasses / weeds*
8. A vegetable garden is left uncared for, which plant species is likely to come back first?  
*Weeds*
9. In which situation would an ecosystem have the greatest number of limiting factors?  
*Lava flow creates new land*
10. A hurricane hits the Texas coast, what type of succession will occur?  
*Secondary Succession*
11. One farmer grows 20 different crops, one farmer grow only 2 different crops, which one is an example of biodiversity?  
*20 different = more biodiversity*
12. When a seed grows the roots grow down and the stem grows up, why?  
*Downward = positive response to gravity*  
*Upward = negative response to gravity*
13. A plant responds to a stimulus by moving either away or towards it, what is that phenomenon called?  
*Tropisms*

A. Baker,2012-12-06 Plants in addition to their role as primary synthesizers of organic compounds have evolved as selective accumulators of inorganic nutrients from the earth s crust This ability to mine the physical

environment is restricted to green plants and some microorganisms other life forms being directly or indirectly dependent on this process for their supply of mineral nutrients The initial accumulation of ions by plants is often spatially separated from the photosynthetic parts necessitating the transport to these parts of the inorganic solutes thus acquired The requirement for energy rich materials by the accumulation process is provided by a transport in the opposite direction of organic solutes from the photosynthetic areas These transport phenomena in plants have been studied at the cellular level the tissue level and the whole plant level The basic problems of analysing the driving forces and the supply of energy for solute transport remain the same for all systems but the method of approach and the type of results obtained vary widely with the experimental material employed reflecting the variation of the solute transporting properties which have selectively evolved in response to both internal and external environmental pressures      Educational Screen and Audiovisual Guide
