Cellular and Molecular Biology of Plant Seed Development Brian A. Larkins, Indra K. Vasil, 2013-03-09 The beginnings of human civilization can be traced back to the time nearly 12 000 years ago when the early humans gradually changed from a life of hunting and gathering food to producing food This beginning of primitive agriculture ensured a dependable supply of food and fostered the living together of people in groups and the development of society During this time plant seeds were recognized as a valuable source of food and nutrition and began to be used for growing plants for food Ever since plant seeds have played an important role in the development of the human civilization Even today seeds of a few crop species such as the cereals and legumes are the primary source of most human food and the predominant commodity in international agriculture Owing to their great importance as food for humans and in international trade seeds have been a favorite object of study by developmental biologists and physiologists nutritionists and chemists A wealth of useful information is available on the biology of seeds

Michael Cooke, 2008-09-02 The main theme of the book is sustainable disease management in a European context Some of the questions addressed are How does society benefit from plant pathology research How can new molecular approaches solve relevant problems in disease management What other fields can we exploit in plant pathology research What challenges are associated with free trade across the new borders How can we contribute to solving problems of developing countries How does plant pathology contribute to food quality and safety How does globalization internationalization affect teaching and extension in plant pathology *Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants* Daoquan Xiang, Zhaorong Hu, Raju

Datla,2025-03-06 Seed development represents an important phase of the life cycle in sexually reproducing plant species A seed is a complex organ system of three components the embryo that contributes to germline continuity endosperm for nourishment and the seed coat for protection The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic molecular biochemical metabolic and physiological pathways and their interactions with environmental cues Research advances in seed development using model and crop species such as Arabidopsis rice maize wheat and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification differentiation and growth programs The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo endosperm and seed coat development However knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield especially in crop plants Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome epigenome transcriptome proteome and metabolome studies and their applications in seed development Bioinformatics and computational tools are also playing important contributions in the large scale genome wide systems level analysis modeling and predictions to identify and characterize the underpinning mechanisms that support seed formation A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene protein and metabolite networks In the proposed Research Topic we highlight current advances in genomics proteomics lipidomics metabolomics metagenomics transcriptomics and phenomics studies of seed development in both model and crop species We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division patterning differentiation and storage reserve accumulation during seed development how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds Marker-assisted selection (MAS) in crop plants Baohua Wang,Peng Chee,Ting Peng,Muhammad Kashif Riaz Khan,2023-03-16
