

# Regulation of Gene Expression

## Big Picture

In order to produce the specific proteins that cells need, cells must regulate DNA transcription so that only certain parts of DNA are transcribed and translated into proteins. Transcription is regulated by regulatory proteins, which control the behavior of RNA polymerase. Regulation in prokaryotic cells involves operons, while regulation in eukaryotic cells involves different types of regulatory elements such as TATA boxes.

## Key Terms

**Gene Expression:** Activating a particular gene to make a protein.

**Regulatory Proteins:** Proteins that regulate DNA transcription.

**Activators:** Regulatory proteins that promote transcription.

**Repressors:** Regulatory proteins that prevent transcription.

**Regulatory Elements:** Regions of DNA where regulatory proteins can bind.

**Promoter:** Region of a gene where a RNA polymerase binds to initiate transcription of the gene.

**RNA Polymerase:** An enzyme that helps produce RNA during transcription.

**Operon:** Region of DNA containing genes that code for proteins with a particular function (usually for prokaryotic cells).

**Operator:** Part of the operon where regulatory proteins bind.

**TATA Box:** Regulatory element in the promoter of most cells.

**Homeobox Genes:** Genes that regulate development.

## How Genes are Regulated

Gene expression is regulated, meaning that specific proteins are made when and where they are needed. This can be done by regulating transcription.

- Transcription is regulated by regulatory proteins.
- Regulatory proteins bind to regulatory elements

Regulatory proteins bind to regulatory elements (DNA sequences).

Types of regulatory proteins:

- **Activators:** promote transcription by helping RNA polymerase interact with promoter.
- **Repressors:** prevent transcription by preventing RNA polymerase from transcribing.

*Regulation of Gene Expression* Gary H. Perdew, Jack P. Vanden Heuvel, Jeffrey M. Peters, 2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates *Regulation of Gene Expression Molecular Mechanisms* is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell
