Relationships and Biodiversity

A laboratory activity for the Living Environment

Background:

Botanocurcus is a valuable plant because it produces curc, a compound used for treating certain kinds of cancer. Curc cannot be produced in the laboratory. *Botanocurcus* grows very slowly and is on the endangered species list, so its ability to provide curc in large quantities is limited.

Species that are more closely related to *Botanocurcus* are more likely to produce the important substance curc because their DNA is similar. If you remember, DNA codes the directions for making proteins and curc is a protein. Three similar plant species that are plentiful (X, Y, and Z) may be related to *Botanocurcus*. You will work as a researcher to:

- gather structural and molecular evidence to determine which plant species is most closely related to the hypothetical species (curc: it is not real), *Botanocurcus*
- use this evidence to decide which plant species is most likely to serve as a source of the important substance curc.

How are we going to figure out which plant is most closely related?
We will use some different tests to complete the task.

- Three different forms of structural evidence.
- An enzyme catalyzed reaction test
- DNA gel Electrophoresis
- Paper Chromatography
- Molecular evidence

Food Systems Evaluation Methods and Sustainability Assessment Bradley George Ridoutt, Aida Turrini, 2024-03-08 The food system is responsible for some of society's most pressing sustainability challenges. Diets are currently unsustainable in many countries as evidenced by the growing burden of malnutrition, degradation of natural resources, contributions to climate change, and unaffordability of healthy diets. There is an urgent need to address the gaps in understanding of what a sustainable food system means across varying populations and geographies and how we can better measure these systems while identifying how dietary choices impact on human health and the environment. However, decision makers and experts are questioning whether it is possible to meet environmental, social, and economic goals simultaneously or whether trade-offs are necessary. Thus, the development of better measurements and indicators to clearly understand the benefits and considerations for healthy and sustainable food systems is needed.
