ATP-gated P2X receptors in health and disease Andrea Nistri, Geoffrey Burnstock, Baljit S Khakh, Rashid Giniatullin, 2015-01-05 Extracellular ATP is currently recognized as one of the most widely distributed neurotransmitters and neuromodulators in the peripheral and central nervous system ATP gated P2X receptors are expressed by neurons glial and many other non neuronal cells and represent an attractive target for therapeutic interventions Diverse molecular and cellular mechanisms have been identified for P2X receptor functioning including the ability to enlarge the size of the ion pore associated with the release of several key immune molecules A major recent breakthrough was the determination of the X ray crystal structures of zebrafish P2X4 receptor in ATP bound and ATP free states The P2X receptor research field is rapidly growing as evidenced by the almost 2000 papers published in the last 5 years However despite the fundamental signalling function of extracellular ATP in the nervous system the widespread roles of P2X receptors have not been widely elucidated and presented in textbooks In this volume of papers we aim to gather a collection of high quality papers detailing the latest insights from the most accomplished international P2X receptor

researchers Importantly basic research into P2X receptors has a strong translational impact and our collection of articles could be a valuable guide for the development of new pharmacological and biotechnological tools addressing the function of P2X receptors Within this collection we plan to cover receptor structure function relationships receptors trafficking to highlight the special properties of P2X receptors and their pharmacological profiles and to describe the translational aspects of cellular ATP signaling in pain and in other neurological and vascular diseases

Mechanisms of Innate Neuroprotection Giuseppe Pignataro, 2016-07-27 As clinical trials of pharmacological neuroprotective strategies in stroke have been disappointing attention has turned to the brain's own endogenous strategies for neuroprotection Two endogenous mechanisms have been recently characterized ischemic preconditioning and ischemic postconditioning In the present topic newly characterized mechanisms involved in preconditioning and postconditioning neuroprotection will be discussed The understanding of the mechanisms involved in the neuroprotective pathways induced by preconditioning and postconditioning will be clinically relevant for identifying new druggable target for neurodegenerative disorder therapy Furthermore the importance of these neuroprotective strategies resides in that it might be easily translatable into clinical practice Therefore the data presented here will highlight the capacity of ischemic preconditioning and postconditioning to be of benefit to humans **Regulation and targeting of enzymes mediating**

Parkinson's disease pathogenesis: focus on Parkinson's disease Kinases, GTPases and ATPases Jean-Marc Taymans, Veerle Baekelandt, Kirsten Harvey, 2015-02-11 Understanding the molecular pathogenesis of Parkinson's disease PD is a priority in biomedical research and a pre requisite to improve early disease diagnosis and ultimately to developing

disease modifying strategies In the past decade and a half geneticists have identified several genes that are involved in the molecular pathogenesis of PD They not only identified gene variants segregating with familial forms of PD but also genetic risk factors of sporadic PD via genome wide association studies GWAS Understanding how PD genes and their gene products function holds the promise of unraveling key PD pathogenic processes Therefore the precise cellular role of PD proteins is currently the subject of intense investigation Interestingly a number of PD proteins have enzymatic functions including kinase GTPase or ATPase functions In the context of understanding disease pathogenesis or developing disease modifying therapies enzymes possess several useful features Firstly enzymes are often key elements of cellular signaling networks acting as on off switches to determine signaling intensity For instance kinases mediate phosphorylation events which activate or inactivate their substrates while GTPases modulate activity of their effector proteins via direct interaction in a GDP GTP dependent manner ATPases also control cellular processes through their involvement in cellular energy production and or in transmembrane transport Secondly enzymes are attractive targets for therapeutics development This is exemplified by the growing number of kinase inhibitors approved for clinical use while compounds modulating GTPases or ATPases have also been proposed as potential therapeutics Finally as elements in cellular signaling networks enzymes are not generally constitutively active but subject to further regulation through additional signaling components Knowledge of how PD kinases GTPases and ATPases are activated or inactivated can aid in understanding how PD signaling networks are deregulated in disease and point to new possibilities in targeting pathological signaling processes The objective of this research topic is to provide an overview of current knowledge on the regulation of cellular signaling networks of PD kinases GTPases and ATPases Both upstream and downstream signaling events will be covered with a focus on molecular events that can readily be monitored relevance as disease biomarkers and have a potential to be modulated relevance as potential therapeutic target

Redox and Nitrosative Signaling in Cardiovascular System: from Physiological Response to Disease Mariarosaria Santillo, Pasquale Pagliaro, 2019-01-22 The role of ROS RNS signaling in cardiovascular functions and diseases is increasingly emerging in the last decades The involvement of ROS RNS in the control of a large number of cardiovascular functions like the regulation of the vascular tone the control of blood pressure or myocyte excitation contraction coupling and force development has been broadly investigated and in part clarified On the other hand many efforts have been focused in clarifying the redox mechanisms involved in cardiovascular diseases like ischemia reperfusion injury diabetes associated cardiovascular dysfunctions atherosclerosis or hypertension just to mention the major ones However in most cases the two levels of investigation remain separate and not interlaced failing in the attempt to provide a unified vision of the pathophysiologic mechanisms of cardiovascular diseases The major aim of the Research Topic has been to collect original papers and review articles dealing with the issue from basic to translation research point of views The topic includes contributions that highlight different interesting aspects of cardiovascular biology with an integrated approach useful for the development of new ideas and advancements in the field of redox signaling in the control of normal cardiovascular functions and their disruption in diseases
