- 1) Were the results from your experiment as you expected? Why? Why not?
- 2) Which is the most reliable estimate of the experimental probability of scoring a '6'?
- 3) How could you get an experimental probability that is closer to the theoretical probability of scoring a '6'?

Section B

The same experiment is conducted using a different dice. The results are recorded in the table. Complete the table leaving answers to two decimal places. Plot the results on the graph and then answer the questions.

Theoretical Models in Biology Glenn W. Rowe, 1994 This book surveys theoretical models in three broad areas of biology: the origin of life, the immune system, and memory in the brain, introducing mathematical and mainly computational models that have been used to construct simulations. Most current books on theoretical biology fall into one of two categories: a) books that specialize in one area of biology and treat theoretical models in considerable depth, and b) books that concentrate on purely mathematical models with computers used only to find numerical solutions to differential equations, for example. Although some mathematical models are considered in this book, the main emphasis is on stochastic computer models of biological systems. Such techniques have a much greater potential for producing detailed realistic models of individual systems and are likely to be the preferred modelling methods of the future. By considering three different areas in biology, the book shows how several of these modelling techniques have been successfully applied in diverse areas. Put simply, this book is important because it shows how the power of modern computers is allowing researchers in theoretical biology to break free of the constraints on modelling that were imposed by the traditional differential equation approach. Anyone who is interested in the theoretical models of

complicated living systems should have this in his or her library G B Ermentrout Bulletin of Mathematical Biology
