

1 Simplex Method

The simplex method is an efficient and widely used LP problem solver. Since proposed by George B. Dantzig in 1947, it has been dominating this area for more than sixty years.

The basic idea behind the simplex method is quite simple. In geometric words, it moves from a vertex to an adjacent vertex, while improving the objective value, until reaching an optimal vertex. It seems to be desirable to hunt for an optimal solution among vertices in the feasible region, as it usually involves infinitely many point but only finitely many vertices (no more than C_n^{in}). So, such a strategy shrinks the hunting scope from the whole feasible region to a finite subset.

The idea may be traced back to as early as Fourier (1982). It was materialized algebraically by Dantzig (1951). In this chapter, the simplex method will be presented in a tableau form first, then it is revised to a more applicable version. Discussed will also be related topics, such as how to get the method started, finiteness problem and finite pivot rules, and computational complexity. The last section will comment on features of the method.

1.1 Simplex Tableau

We begin with introduction of the so-called “simplex tableau” for the LP problem. We have already obtained the canonical form of its constraint system, without touching the objective function at all. Now we put the objective function in the equation form

$$x_1 + 2x_2 - x_4 + x_5 - f = 0,$$

where f is called *objective variable*, at the bottom of the constraint system. The according tableau is

x_1	x_2	x_3	x_4	x_5	f	RHS
1			2/11	-4/11		7/11
	1		15/11	-19/11		14/11
		1	1/11	9/11		9/11

Complex Scheduling Peter Brucker, Sigrid Knust, 2006-04-26 Scheduling problems have been investigated since the late fifties Two types of applications have mainly motivated research in this area project planning and machine scheduling While in machine scheduling a large number of specific scheduling situations depending on the machine environment and the job characteristics have been considered the early work in project planning investigated scheduling situations with precedence constraints between activities assuming that sufficient resources are available to perform the activities More recently in project scheduling scarce resources have been

taken into account leading to so called resource constrained project scheduling problems On the other hand also in machine scheduling more general and complex problems have been investigated Due to these developments today both areas are much closer to each other Furthermore applications like timetabling rostering or industrial scheduling are connected to both areas This book deals with such complex scheduling problems and methods to solve them It consists of three parts The first part Chapters 1 and 2 contains a description of basic scheduling models with applications and an introduction into discrete optimization covering complexity shortest path algorithms linear programming network flow algorithms and general optimization methods In the second part Chapter 3 resource constrained project scheduling problems are considered Especially methods like constraint propagation branch and bound algorithms and heuristic procedures are described Furthermore lower bounds and general objective functions are discussed
