Section 4.2 Human Population Growth

In your notebook, read about demographic trends.

Determine if the statement is true. If it is not, rewrite the italicized part to make it true.

1. Looking at past population trends is a good way to predict the future of human populations.

2. Demography is the study of population *health* characteristics.

3. Worldwide human populations have *decreased* exponentially over the past few centuries.

4. Humans are able to *decrease* environmental effects on the human population through controlling disease, eliminating competing organisms, and increasing food production.

5. To tell whether a population is growing, you must know the difference between the birthrate and the death rate.

6. The death rate is *decreasing* in the United States.

7. The birthrate is *increasing* in the United States.

8. *Survivor* is the number of offspring a female produces during her reproductive years.

9. In the United States, families are now *smaller* than in previous decades.

10. Birthrates and death rates of countries around the world are *basically* the same.

11. If a country has a high death rate, it may also have a high birthrate.

12. If a country has a low death rate and a high birthrate, it will grow slowly, if at all.

support and under which conditions become pressing Some of the questions and challenges raised can be addressed through the use of mathematical models but not all The goal of this book is to search for a balance between simple and analyzable models and unsolvable models which are capable of addressing important questions such as these Part I focusses on single species simple models including those which have been used to predict the growth of human and animal population in the past Single population models are in some sense the building blocks of more realistic models the subject of Part II Their role is fundamental to the study of ecological and demographic processes including the role of population structure and spatial heterogeneity the subject of Part III This book which includes both examples and exercises will be useful to practitioners graduate students and scientists working in the field

The Population Ecology of Interest Representation Virginia Gray, David Lowery, 1996 This examination of lobbying communities explores how interest group populations are constructed and how they influence politics and public policy By examining how populations of interest groups are comprised this work fills an important gap between existing theories of the origins of individual interest groups and studies of interest group influence The population ecology model of interest communities developed here builds on insights first developed in population biology and later employed by organizational ecologists The model's central premise is that it is the environmental forces confronting interest organizations that most directly shape the contours of interest populations After examining the demography of interest organizations in the fifty American states the population ecology model is used to account for variations in the density and diversity of their interest communities the nature of competition among similar interest organizations to establish viable niches and the impact of alternative configurations of interest communities on the legislative process and the policies it produces These empirical findings suggest that the environment of interest communities is highly constraining limiting their size composition and potential impact on politics Virginia Gray is Professor of Political Science University of Minnesota David Lowery is Burton Craige Professor of Political Science University of North Carolina at Chapel Hill

The Population Biology of Tuberculosis Christopher Dye, 2015-07-07 Despite decades of developments in immunization and drug therapy tuberculosis remains among the leading causes of human mortality and no country has successfully eradicated the disease Reenvisioning tuberculosis from the perspective of population biology this book examines why the disease is so persistent and what must be done to fight it Treating tuberculosis and its human hosts as dynamic interacting populations Christopher Dye seeks new answers to key questions by drawing on demography ecology epidemiology evolution and population genetics Dye uses simple mathematical models to investigate how cases and deaths could be reduced and how interventions could lead to TB elimination Dye's analysis reveals a striking gap between the actual and potential impact of current interventions especially drug treatment and he suggests placing more emphasis on early case detection and the treatment of active or incipient tuberculosis He argues that the response to disappointingly slow rates of disease decline is not to abandon long established principles of chemotherapy but to implement them with greater vigor Summarizing epidemiological insights from population biology Dye stresses the need to take a more inclusive view of the factors that affect disease including characteristics of the pathogen individuals and populations health care systems and physical and social environments In broadening the horizons of TB research *The Population Biology of Tuberculosis* demonstrates what must be done to prevent control and defeat this global threat in the twenty first century *National Geographic Answer Book* National Geographic, 2015 This far reaching reference is designed with many entry points and a visually engaging format to satisfy the curious browser the student researcher and the earnest knowledge seeker alike

Theoretical Ecology Robert May, Angela R. McLean, 2007-02-15 Robert May's seminal book has played a central role in the development of ecological science Originally published in 1976 this influential text has overseen the transition of ecology from an observational and descriptive subject to one with a solid conceptual core Indeed it is a testament to its influence that a great deal of the novel material presented in the earlier editions has now been incorporated into standard undergraduate textbooks It is now a quarter of a century since the publication of the second

edition and a thorough revision is timely Theoretical Ecology provides a succinct up to date overview of the field set in the context of applications thereby bridging the traditional division of theory and practice It describes the recent advances in our understanding of how interacting populations of plants and animals change over time and space in response to natural or human created disturbance In an integrated way initial chapters give an account of the basic principles governing the structure function and temporal and spatial dynamics of populations and communities of plants and animals Later chapters outline applications of these ideas to practical issues including fisheries infectious diseases tomorrow s food supplies climate change and conservation biology Throughout the book emphasis is placed on questions which as yet remain unanswered The editors have invited the top scientists in the field to collaborate with the next generation of theoretical ecologists The result is an accessible advanced textbook suitable for senior undergraduate and graduate level students as well as researchers in the fields of ecology mathematical biology environment and resources management It will also be of interest to the general reader seeking a better understanding of a range of global environmental problems **Social Behaviour** Tamás

Székely, Allen J. Moore, Jan Komdeur, 2010-11-18 A comprehensive analysis of the genetic ecological and phylogenetic aspects of social behaviour by experts in the field *Restoration Ecology* Jelte van Andel, James Aronson, 2009-03-12 Aimed at Masters and PhD students teachers researchers and natural resource managers this book explores the interface between restoration ecology and ecological restoration Covers both the ecological concepts involved in restoration ecology and their practical applications Written by an excellent group of ecologists from centres across Europe with a strong reputation for restoration ecology Only textbook around aimed specifically at advanced undergraduate courses and postgraduate study programmes
