

Sound waves will diffract more because they have wavelengths that are substantially longer than those of light waves.

Activity C:
Interference

Get the Gizmo ready:

- Select **Single central source**. Check that the **Wavelength** is 16.0 cm.
- Set the **Wave strength** to 1.00.

Question: What happens when waves combine?

1. Observe: Press **Play**. Describe the waves you see:

Radiate away and circular.

Where might you see waves like this in nature?

at a pond.

2. Observe: Select **Two central sources** and set the **Wave strength** to 1.00. Press **Play**. What do you notice when the waves from the two sources collide?

When the waves meet, a pattern of spots that each represent a different crest and dip emerges.

3. Sketch: In the box at right, shade in any areas that seem to stay at the same height all the time. (Note: The two wave sources are marked with dots.)

4. Conjecture: Why do you think there are places that stay near an average height all the time?

Conjectures will differ.

5. Analyze: A helpful characteristic of combined waves is that they can be analyzed separately. To calculate the height of a point that is affected by two waves, simply add the heights of each wave. This idea is called the **law of superposition**.

Suppose the two waves shown below are combined.  Sketch what the resulting wave would look like. (Hint: Add up the two waves at each point, and then trace the resulting curve.)

 Either hand draw or click to **EDIT** to use the drawing tool.
