Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

1. Suppose you want to design and build a house. How would you communicate your design plans with the construction crew that would work on the house?

2. Cells build large, complicated molecules, such as proteins. What do you think cells use as their "design plans" for proteins?

Gizmo Warm-up

Just as a construction crew uses blueprints to build a house, a cell uses DNA as plans for building proteins. In addition to DNA, another nucleic acid, called **RNA**, is involved in making proteins. In the *RNA and Protein Synthesis* Gizmo™, you will use both DNA and RNA to construct a protein out of **amino acids**.

1. DNA is composed of the bases adenine (A), cytosine (C), guanine (G), and thymine (T). RNA is composed of adenine, cytosine, guanine, and uracil (U).

Look at the SIMULATION pane. Is the displayed segment a part of a DNA or RNA molecule? How do you know?

2. **RNA polymerase** is a type of enzyme. Enzymes help chemical reactions occur quickly. Click the **Release enzyme** button, and describe what happens.

Transfer RNA in Protein Synthesis Dolph L. Hatfield, 2018-01-10 *Transfer RNA in Protein Synthesis* is a comprehensive volume focusing on important aspects of codon usage selection and discrimination in the genetic code. The many different functions of tRNA and the specialized roles of the corresponding codewords in protein synthesis from initiation through termination are thoroughly discussed. Variations that occur in the initiation process in reading the genetic code and in the selection of codons are discussed in detail. The book also examines the role of modified nucleosides in tRNA interactions, tRNA discrimination in aminoacylation, codon discrimination in translation, and selective use of termination codons. Other topics covered include the adaptation of the tRNA population to codon usage in cells and cellular organelles, the occurrence of UGA as a codon for selenocysteine in the universal genetic code, new insights into translational context effects and in codon bias, and the molecular biology of tRNA in retroviruses. The contributions of outstanding molecular biologists engaged in tRNA research and prominent investigators from other scientific disciplines, specifically retroviral research, make *Transfer RNA in Protein Synthesis* an essential reference work for microbiologists, biochemists, molecular biologists, geneticists, and other researchers involved in protein synthesis research.

Lucchesi, 2018-12-19 Epigenetics is the study of heritable changes in gene function that do not involve changes in the DNA sequence These changes consisting principally of DNA methylation histone modifications and non coding RNAs maintain or modulate the initial impact of regulatory factors that recognize and associate with particular genomic sequences Epigenetic modifications are manifest in all aspects of normal cellular differentiation and function but they can also have damaging effects that result in pathologies such as cancer Research is continuously uncovering the role of epigenetics in a variety of human disorders providing new avenues for therapeutic interventions and advances in regenerative medicine This book s primary goal is to establish a framework that can be used to understand the basis of epigenetic regulation and to appreciate both its derivation from genetics and interdependence with genetic mechanisms A further aim is to highlight the role played by the three dimensional organization of the genetic material itself the complex of DNA histones and non histone proteins referred to as chromatin and its distribution within a functionally

compartmentalized nucleus This architectural organization of the genome plays a major role in the subsequent retrieval interpretation and execution of both genetic and epigenetic information
