

British Tertiary Igneous Province

*Abundant igneous activity in North-West Britain due to the **tension** related to the opening of the North Atlantic Ocean*

Thing to be found-

| Igneous body | Example |
|------------------------------|-----------------|
| Flood Basalts | Isle of Mull |
| Plutons (granite and gabbro) | Isle of Skye |
| Dyke Swarms | Isle of Arran |
| Sills | Drumadoon Sill |
| Columnar jointing | Giant's Causway |

Flood basalts developed as partial melting in the mantle below the continental crust resulting from tension and this resulted in; **Columnar jointing** due to slow cooling of lava flows

Magmatic differentiation in magma chambers developed, leading to **mafic and silicic intrusions**. E.G Skye has two magma chambers one mafic and one silicic. The Black Cuillins are made of gabbro with many dolerite dykes and the Red Cuillins are made of granite.

Volcanic activity was **explosive** and further tension led to extensive **dyke swarms**.

Important to remember that at the same time as the British tertiary igneous province, the Alpine Orogeny was occurring too. Britain was on the 'edge' of Destructive Plate margin and we were on the outer fringes of collision between Africa and Europe forming Alps. Structural evidence - folding in southern England (Lulworth Crumple)

British Tertiary Igneous Province – Tension

Alpine Orogeny - Compression

Evaluation

- Mantle plume develops beneath northwest UK and Greenland.
- Rifting and development of spreading centre, opening of North Atlantic.
- Large volume of (flood) basalt associated with mantle plumes.
- Hot spot trail to Iceland. Mid ocean ridge still active.
- Evidence of tension (dykes etc.)
- Later granitic intrusions due to melting of continental crust.
