Polymerase Chain Reaction

Synopsis

In this Polymerase Chain Reaction (PCR) simulation, you will see through eight steps another method, known as restriction fragment length polymorphism (RFLP), for identifying the crime scene DNA sample. First, you'll see the subject's initial opinion on the issue that the investigator has left to you, at the end of the page.

Design the test

After sampling, you will go to the restriction enzyme step. The samples of DNA you collected by using a microchip is then digested, and this is followed by heat, the entire process is called the PCR. In order that correct results are obtained, the PCR is performed.

View the structure of DNA sample restriction enzyme

In the simulation, you will see the PCR experiment on the computer, which illustrates the structure of DNA and the restriction enzyme. Restriction enzyme is used to identify the experimental process, as well as all the functions of the PCR test.

Identify the samples

In the PCR simulation, you will collect your samples and other samples collected from the laboratory, and you will then compare the fragments for analysis. This will give you the results of the simulation.

Learning Objectives

In this case of this simulation, you will see the results:

1. Identify the function of PCR (polymerase chain reaction) and restriction.
2. Explain the PCR process using the PCR test, which is the PCR test on the simulation.
