MAIN PROGRAM NAME: cvort

PURPOSE: To compute Centrifugal Velocity OR Times for settling specific particles from a given medium.

PROGRAM SYNOPSIS: cvort[-mtpv]

SOURCE LANGUAGE: This version of the program was written in "c"

COMPILING: The program can be compiled to run under UNIX
Type the command "cc cvort.c -lm"
The output executable "a.out" should be renamed cvort

DESCRIPTION: The user may compute the total running time and T - td (time to start deceleration) for a given particle to be completely settled from a given medium.

When no options are specified, it is assumed that the medium is water at 20 degrees Centigrade and the particle is quartz (sp = 2.65 gm/cc).

OPTIONS:

-t - The 't' option on the run-line causes a query for a temperature between 16-40 degrees Centigrade. The viscosity and specific gravity of water at that temperature is selected from the program look-up table.

It is not necessary to know the temperature of any other medium or water outside the look-up table range since those medium must be described by specifying the 'm' option on the run-line.

-m - The 'm' option will cause the program to prompt the user for a viscosity (poise) and a specific gravity (g/cc) of the medium.

-p - The 'p' option is used when the particulate to be settled is not quartz.

-v - The 'v' option will assume the user has a specific total time (with appropriate acceleration time and deceleration time) and would
