

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in the 1960s, based on his studies of intertidal ecosystems. Paine found that the removal of a single species, the starfish *Pisaster ochaceus*, led to a dramatic change in the community structure of the rocky shore.

Keystone species play a critical role in maintaining the structure of an ecosystem. They can be found in a wide variety of habitats, from coral reefs to grasslands. Some keystone species are predators, while others are engineers or mutualists. The Saguaro Cactus is a keystone species in the Sonoran Desert.

Why is the Saguaro a keystone species?

The Saguaro Cactus is a keystone species because it provides a variety of services to the ecosystem. It provides food and shelter for many animals, including birds, lizards, and insects. It also plays a role in the water cycle by storing water in its thick stems. The Saguaro Cactus is a symbol of the Sonoran Desert and is a popular sight for visitors to the region.
