

### Question 5

$$w = \frac{z+i}{iz+2}$$

$$i) z = 1+i \quad w = \frac{1+i}{i+i^2+2} = \frac{1+i}{i-1+2} = \frac{1+i}{1-i} = \frac{1+2i-i-2i^2}{1-i^2}$$

$$w = \frac{3+i}{2} = \frac{3}{2} + \frac{1}{2}i$$

ii) if  $w = z$  find  $\operatorname{Re}(z)$

$$z = \frac{z+i}{iz+2} \rightarrow iz^2 + 2z = z+i$$

$$z^2i + 2z - i - i = 0$$

$$z^2i - i = 0$$

$$\Delta = b^2 - 4ac = 1^2 - 4 \cdot i \cdot (-i) = 1 - 4 = -3$$

$$z_{1,2} = \frac{-1 \pm \sqrt{-3}}{2i} = \frac{-1 \pm \sqrt{3}i}{2i}$$

$$z_{1,2} = \frac{-i \mp \sqrt{3}}{-2} \rightarrow z_1 = \frac{\sqrt{3}-i}{-2} = -\frac{\sqrt{3}}{2} + \frac{1}{2}i$$

$$\operatorname{Re}(z) < 0$$

$$z = -\frac{\sqrt{3}}{2} + \frac{1}{2}i$$

$$z_2 = \frac{-\sqrt{3}-i}{-2} = \frac{\sqrt{3}}{2} + \frac{1}{2}i$$

**Almost Periodic Type Solutions** Marko Kostić, 2025-03-03 Maybe for the first time in the existing literature we investigate here the almost periodic type solutions to the abstract Volterra difference equations depending on several variables We also investigate the generalized almost periodic type sequences and their applications in a rather detailed manner as well as many new important spaces of metrically generalized almost periodic type spaces of sequences and functions We essentially apply some results from the theory of  $C$  regularized solution operator families to the abstract Volterra integro differential difference equations contributing also to the theory of fractional calculus and fractional differential equations The theory of abstract Volterra integro differential equations and the theory of abstract Volterra difference equations are very attractive fields of research of many authors The almost periodic features and the asymptotically almost periodic features of solutions to the abstract Volterra differential difference equations in Banach spaces have been sought in many research articles published by now The main aim of this monograph is to continue the work collected in my monographs published with W de Gruyter recently by providing several new results about the existence and uniqueness of almost periodic type solutions to the abstract Volterra integro differential difference equations which could be solvable or unsolvable with respect to the highest derivative order We would like to particularly emphasize that this is probably the first research monograph devoted to the study of almost periodic type solutions to the abstract Volterra difference equations depending on several variables We also consider here many new important spaces of metrically generalized almost periodic type spaces of sequences and functions and their almost automorphic analogues It is also worth noting that this is probably the first research monograph which concerns the generalized almost periodic type sequences and their applications in a rather detailed manner for the first time in the existing literature we also present here some applications of results from the theory of  $C$  regularized solution operator families to the abstract Volterra difference equations Fractional calculus and discrete fractional calculus are rapidly growing fields of theoretical and applied mathematics which are incredibly important in modeling of various real phenomena appearing in different fields like aerodynamics rheology interval valued systems chaotic systems with short memory and image encryption and discrete time recurrent neural networks Many important research results regarding the abstract fractional differential equations and the abstract fractional difference equations in Banach spaces have recently been obtained by a great number of authors from the whole world In this monograph we also contribute to the theories of discrete fractional calculus fractional differential

Numerical Verification Methods and Computer-Assisted Proofs for Partial Differential Equations Mitsuhiro T. Nakao,Michael Plum,Yoshitaka Watanabe,2019-11-11 In the last decades various mathematical problems have been solved by computer assisted proofs among them the Kepler conjecture the existence of chaos the existence of the Lorenz attractor the famous four color problem and more In many cases computer assisted proofs have the remarkable advantage compared with a theoretical proof of additionally providing accurate quantitative information The authors have been working more than a quarter century to establish methods for the verified computation of solutions for partial differential equations mainly for nonlinear elliptic problems of the form  $u_f(x,u)$  with Dirichlet boundary conditions Here by verified computation is meant a computer assisted numerical approach for proving the existence of a solution in a close and explicit neighborhood of an approximate solution The quantitative information provided by these techniques is also significant from the viewpoint of a posteriori error estimates for approximate solutions of the concerned partial differential equations in a mathematically rigorous sense In this

monograph the authors give a detailed description of the verified computations and computer assisted proofs for partial differential equations that they developed In Part I the methods mainly studied by the authors Nakao and Watanabe are presented These methods are based on a finite dimensional projection and constructive a priori error estimates for finite element approximations of the Poisson equation In Part II the computer assisted approaches via eigenvalue bounds developed by the author Plum are explained in detail The main task of this method consists of establishing eigenvalue bounds for the linearization of the corresponding nonlinear problem at the computed approximate solution Some brief remarks on other approaches are also given in Part III Each method in Parts I and II is accompanied by appropriate numerical examples that confirm the actual usefulness of the authors methods Also in some examples practical computer algorithms are supplied so that readers can easily implement the verification programs by themselves
