Abstract: This research was designed to investigate the effects of two types of social support on the well-being of individuals who are experiencing chronic pain. The study involved 100 participants who were assigned to one of four groups based on the type of social support they received. The results showed that individuals who received emotional support experienced significantly lower levels of pain and improved quality of life compared to those who did not receive support. These findings suggest that providing emotional support can be an effective intervention for managing chronic pain.
