algebraic structures is thus essential to design robust cryptographic schemes This Special Issue is concerned with the interplay between group theory symmetry and cryptography The book highlights four exciting areas of research in which these fields intertwine post quantum cryptography coding theory computational group theory and symmetric cryptography The articles presented demonstrate the relevance of rigorously analyzing the computational hardness of the mathematical problems used as a base for cryptographic constructions For instance decoding problems related to algebraic codes and rewriting problems in non abelian groups are explored with cryptographic applications in mind New results on the algebraic properties or symmetric cryptographic tools are also presented moving ahead in the understanding of their security properties In addition post quantum constructions for digital signatures and key exchange are explored in this Special Issue exemplifying how and how not group theory may be used for developing robust cryptographic tools to withstand quantum attacks *Catalog of Copyright Entries.
