Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. They were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of aerobic exercise at 60% of maximum HR. The control group did not exercise. The HR and EE were measured at rest and during exercise at 60% of maximum HR. The HR and EE were significantly higher in the training group than in the control group at rest and during exercise. The results of this study suggest that a 10-week training program can improve the HR and EE of sedentary, middle-aged women.

If the contribution margin is C , then the contribution margin ratio is C/T (expressed as a decimal). And, the contribution margin ratio is $C/T = (T - \text{fixed costs})/T$, and we can rearrange the equation to get:
