Population and Community Ecology for Insect Management and Conservation J. Baumgartner, 2020-03-09 One of the themes of the 20th International Congress of Entomology held in Florence in August 1996 was Ecology and Population Dynamics with papers presented on single species dynamics population interactions and community ecology This book contains a selection of the papers that were presented and gives a late 1990s picture of the latest research in this fast developing area Holt Biology Rob DeSalle, Holt Rinehart and Winston, 2008 Holt Biology Student Edition 2008

Competition Theory in Ecology Peter A. Abrams, 2022 This novel textbook addresses the shortcomings of current competition theory and suggests a more useful approach that can provide a basis for future models that have far greater predictive ability in both ecology and evolution Parasitism and Ecosystems Frédéric Thomas, François Renaud, Jean-François Guegan, 2005-01-06 For several years there has been a growing interest in understanding the dynamics of parasites in ecosystems as well as the diversity of ways in which they influence ecosystem functioning through their effects on host populations and communities Ecologists epidemiologists evolutionary biologists and other scientists are increasingly coming to realise that parasites must be taken into account when studying ecosystems *Parasitism and Ecosystems* summarizes current knowledge on this topic providing a comprehensive overview for researchers and students It represents the first synthesis of both the roles and the consequences of pathogens in ecosystems utilising well documented case studies to illustrate the main issues as well as identifying prospects for future research **Temporal Dynamics and Ecological Process** Colleen K. Kelly, Michael G. Bowler, Gordon A. Fox, 2014-01-16 In contrast with the fundamental ecological expectation that similarity induces competition and loss of species temporal dynamics allows similar species to co occur In fact the coexistence of similar species contributes significantly to species diversity and could affect ecosystem response to climate change However because temporal processes take place over time they have often been a challenge to document or even to identify *Temporal Dynamics and Ecological Process* brings together studies that have met this challenge and present two specific aspects of temporal processes reproductive scheduling and the stable coexistence of similar species By using plants to extract general principles these studies uncover deep ties between temporal niche dynamics and the above central ecological issues thereby providing a better understanding of what drives temporal processes in nature Written by leading scientists in the field this title will be a valuable source of reference to research ecologists and those interested in temporal ecology **Community Ecology** Herman A. Verhoef, Peter J. Morin, 2010 Community ecology is the study of the interactions between populations of co existing species Co edited by two prominent community ecologists and featuring contributions from top researchers in the field this book provides a survey of the state of the art in both the theory and applications of the discipline It pays special attention to topology dynamics and the importance of spatial and temporal scale while also looking at applications to emerging problems in human dominated ecosystems including the restoration and

reconstruction of viable communities Community Ecology Processes Models and Applications adopts a mainly theoretical approach and focuses on the use of network based theory which remains little explored in standard community ecology textbooks The book includes discussion of the effects of biotic invasions on natural communities the linking of ecological network structure to empirically measured community properties and dynamics the effects of evolution on community patterns and processes and the integration of fundamental interactions into ecological networks A final chapter indicates future research directions for the discipline

Theory-based Ecology Liz Pásztor,Zoltán Botta-Dukát,Gabriella Magyar,Tamás Czárán,Géza Meszéna,2016 The first text to adopt a Darwinian approach to develop a universal coherent and robust theory of ecology and provide a unified treatment of ecology and evolution

Response of Model Microbial Communities to Increased Productivity Brendan James Marc Bohannan,1997

Community Ecology Peter J. Morin,2009-04-13 Community ecology the study of the patterns and processes involving two or more species has developed rapidly in the last two decades driven by new and more sophisticated research techniques advances in mathematical theory and modeling and the increasing pressure on the environment wrought by humans Once a purely descriptive science it is now one of the most forward looking areas of scientific inquiry Morin skillfully guides the reader through the main tenets and central concepts of community ecology competition predation food webs indirect effects habitat selection diversity and succession In an attempt to introduce the reader to the most balanced coverage possible Morin includes examples drawn from both the aquatic and terrestrial realm and from both plant and animal species Balancing theory with experimentation and drawing on exciting new studies to complement the historical foundations of the discipline he also stresses that both the empirical and theoretical approaches are necessary to drive ecology forward into the new millenium The final chapter on applied community ecology ably demonstrates how community ecological processes have a wide environmental relevance Although in its infancy the application of community ecology to emerging problems in human dominated ecosystems could mitigate problems as diverse as management strategies for important diseases transmitted by animals and the restoration and reconstruction of viable communities Required reading for all students and practitioners interested in community phenomena Community Ecology marks an important contribution to the development of this protean discipline The first serious textbook for a decade on one of the keystone subdisciplines of ecology Broad taxonomic and habitat coverage Section on implications of community ecology for environmental issues

Mapping the Future of Biology Anouk Barberousse,Michel Morange,Thomas Pradeu,2009-02-26 Carving Nature at its Joints In order to map the future of biology we need to understand where we are and how we got there Present day biology is the realization of the famous metaphor of the organism as a bete machine elaborated by Descartes in Part V of the Discours a realization far beyond what anyone in the seventeenth century could have im ined Until the middle of the nineteenth century that machine was an articulated collection of macroscopic parts a system of gears and levers moving gasses solids and

liquids and causing some parts of the machine to move in response to the force produced by others. Then in the nineteenth century two divergent changes occurred in the level at which the living machine came to be investigated. First with the rise of chemistry and the particulate view of the composition of matter the forces on macroscopic machine came to be understood as the manifestation of molecular events and functional biology became a study of molecular interactions. That is the machine ceased to be a clock or a water pump and became an articulated network of chemical reactions. Until the first third of the twentieth century this chemical view of life as reflected in the development of classical biochemistry treated the chemistry of biological molecules in much the same way as for any organic chemical reaction with reaction rates and side products that were the consequence of statistical properties of the concentrations of reactants. *Community Ecology* Gary G.

Mittelbach, Brian J. McGill, 2019-05-24 Community ecology has undergone a transformation in recent years from a discipline largely focused on processes occurring within a local area to a discipline encompassing a much richer domain of study including the linkages between communities separated in space, metacommunity dynamics, niche and neutral theory, the interplay between ecology and evolution, eco-evolutionary dynamics and the influence of historical and regional processes in shaping patterns of biodiversity. To fully understand these new developments, however, students continue to need a strong foundation in the study of species interactions and how these interactions are assembled into food webs and other ecological networks. This new edition fulfils the book's original aims both as a much needed up to date and accessible introduction to modern community ecology and in identifying the important questions that are yet to be answered. This research driven textbook introduces state of the art community ecology to a new generation of students adopting reasoned and balanced perspectives on as yet unresolved issues. *Community Ecology* is suitable for advanced undergraduates, graduate students and researchers seeking a broad up to date coverage of ecological concepts at the community level. *Coexistence in Ecology*

Mark A. McPeck, 2022-02-08 A comprehensive framework for understanding species coexistence. Coexistence is the central concept in community ecology but an understanding of this concept requires that we study the actual mechanisms of species interactions. *Coexistence in Ecology* examines the major features of these mechanisms for species that coexist at different positions in complex food webs and derives empirical tests from model predictions. Exploring the various challenges species face, Mark McPeck systematically builds a model food web beginning with an ecosystem devoid of life and then adding one species at a time. With the introduction of each new species he evaluates the properties it must possess to invade a community and quantifies the changes in the abundances of other species that result from a successful invasion. McPeck continues this process until he achieves a multitrophic level food web with many species coexisting at each trophic level from omnivores, mutualists and pathogens to herbivores, carnivores and basic plants. He then describes the observational and experimental empirical studies that can test the theoretical predictions resulting from the model analyses. Synthesizing decades of theoretical research in community ecology, *Coexistence in Ecology* offers new perspectives on how to develop an

empirical program of study rooted in the natural histories of species and the mechanisms by which they actually interact with one another **Control of Pests and Weeds by Natural Enemies** Roy van Driesche, Mark Hoddle, Ted Center, 2009-01-26

Biological control utilizing a population of natural enemies to seasonally or permanently suppress pests is not a new concept. The cottony cushion scale which nearly destroyed the citrus industry of California was controlled by an introduced predatory insect in the 1880s. Accelerated invasions by insects and spread of weedy non native plants in the last century have increased the need for the use of biological control. Use of carefully chosen natural enemies has become a major tool for the protection of natural ecosystems biodiversity and agricultural and urban environments. This book offers a multifaceted yet integrated discussion on two major applications of biological control: permanent control of invasive insects and plants at the landscape level and temporary suppression of both native and exotic pests in farms, tree plantations and greenhouses. Written by leading international experts in the field, the text discusses control of invasive species and the role of natural enemies in pest management. This book is essential reading for courses on Invasive Species, Pest Management and Crop Protection. It is an invaluable reference book for biocontrol professionals, restorationists, agriculturalists and wildlife biologists. Behavioral Mechanisms in Evolutionary Ecology Leslie Real, 1994-11-30. The first book length exploration of behavioral mechanisms in evolutionary ecology, this ambitious volume illuminates long standing questions about cause and effect relations between an animal's behavior and its environment. By focusing on biological mechanisms, the sum of an animal's cognitive, neural, developmental and hormonal processes, leading researchers demonstrate how the integrated study of animal physiology, cognitive processes and social interaction can yield an enriched understanding of behavior. With studies of species ranging from insects to primates, the contributors examine how various animals identify and use environmental resources and deal with ecological constraints as well as the roles of learning, communication and cognitive aspects of social interaction in behavioral evolution. Taken together, the chapters demonstrate how the study of internal mechanistic foundations of behavior in relation to their ecological and evolutionary contexts and outcomes provides valuable insight into such behaviors as predation, mating and dispersal. *Behavioral Mechanisms in Evolutionary Ecology* shows how a mechanistic approach unites various levels of biological organization to provide a broader understanding of the biological bases of behavioral evolution.

Ecological Versatility and Community Ecology Ralph C. MacNally, 1995-09-21. A comprehensive analysis of ecological specialisation and generalisation in natural communities, first published in 1995. *Multitrophic Interactions in Terrestrial Systems* A. C. Gange, V. K. Brown, 2002-08. Multitrophic interactions are now recognised as being of the utmost importance in understanding the complexity of the natural world. However, their complex nature had often been a barrier to their study as they require research teams composed of workers often with very disparate interests. This book therefore takes a multidisciplinary approach to complex interactions across many trophic levels and includes authors from

disciplines as diverse as mycology entomology nematology population ecology and theoretical ecology Throughout the direct and indirect interactions between organisms from different trophic levels are emphasised in comprehensive reviews bringing a fresh collaborative approach to community ecology The book is ideal for those seeking an overview of our understanding of multitrophic interactions as well as directions for future research

Foundations of Ecology II Thomas E. Miller, Joseph Travis, 2022-09-06 For three decades *Foundations of Ecology* edited by Leslie A Real and James H Brown has served as an essential primer for graduate students and practicing ecologists giving them access to the classic papers that laid the foundations of modern ecology alongside commentaries by noted ecologists Ecology has continued to evolve and ecologists Thomas E Miller and Joseph Travis offer here a freshly edited guide for a new generation of researchers The period of 1970 to 1995 was a time of tremendous change in all areas of this discipline from an increased rigor for experimental design and analysis and the reevaluation of paradigms to new models for understanding to theoretical advances *Foundations of Ecology II* includes facsimiles of forty six papers from this period alongside expert commentaries that discuss a total of fifty three key studies addressing topics of diversity predation complexity competition coexistence extinction productivity resources distribution and abundance The result is more than a catalog of historic firsts this book offers diverse perspectives on the foundational papers that led to today's ecological work

The Ecology of Large Mammals in Central Yellowstone Robert A. Garrott, Patrick J. White, Fred G.R. Watson, 2008-11-25 This book is an authoritative work on the ecology of some of America's most iconic large mammals in a natural environment and of the interplay between climate landscape and animals in the interior of the world's first and most famous national park Central Yellowstone includes the range of one of the largest migratory populations of bison in North America as well as a unique elk herd that remains in the park year round These populations live in a varied landscape with seasonal and often extreme patterns of climate and food abundance The reintroduction of wolves into the park a decade ago resulted in scientific and public controversy about the effect of large predators on their prey a debate closely examined in the book Introductory chapters describe the geography geology and vegetation of the ecosystem The elk and bison are then introduced and their population ecology described both pre and post wolf introduction enabling valuable insights into the demographic and behavioral consequences for their ungulate prey Subsequent chapters describe the wildlife human interactions and show how scientific research can inform the debate and policy issues surrounding winter recreation in Yellowstone The book closes with a discussion of how this ecological knowledge can be used to educate the public both about Yellowstone itself and about science ecology and the environment in general Yellowstone National Park exemplifies some of the currently most hotly debated and high profile ecological wildlife management and environmental policy issues and this book will have broad appeal not only to academic ecologists but also to natural resource students managers biologists policy makers administrators and the general public Unrivalled descriptions of ecological processes in a world famous ecosystem based on information from 16 years of painstaking field work and

collaborations among 66 scientists and technical experts and 15 graduate studies Detailed studies of two charismatic North American herbivore species elk and bison Description of the restoration of wolves into central Yellowstone and their ecological interactions with their elk and bison prey Illustrated with numerous evocative colour photographs and stunning maps

The Structure and Dynamics of Geographic Ranges Kevin J. Gaston, 2003-05-01 No species occurs everywhere Indeed the majority are absent from most places and where they do occur they are usually quite rare Gaston discusses the structure of these distributions the structure of the geographic ranges of species Gaston is particularly concerned with the factors that determine the limits to a species geographic range how the sizes of those ranges vary and patterns in that variation Also considered are the distribution of individuals amongst those sites where a species does occur and what determines that distribution and some of the practical implications of all these Both in a pure and applied context ecologists need a broader perspective on their subject matter than has historically prevailed This book provides one such perspective A must have book for any researchers and graduate students studying macroecology biogeography and conservation biology
