

Study Guide for Exam #2 in Psychology 230

1. Perceptual Development

- a. **Describe the methods used to study perception in infants. What do these methods tell us?**
 - Preference method: two objects are presented simultaneously, and we record how long an infant attends (looks @) each one, shows that infants can distinguish between stimuli
 - Habituation method: a stimulus becomes so familiar/boring that infants stop showing any response to it (aka: habituates), shows ability to distinguish old vs. new
 - Evoked potentials: present with a stimulus and record brain waves, brain waves are used to measure preference/ dishabituation and habituation at any given millisecond
- b. **What kinds of patterns can newborns see? When can they see patterns like adults?**
 - Infants age 2 mo.+ can discriminate patterns similar to adults (even highly complex ones)
 - Infants 0-2 mo. can only discriminate moderately complex patterns, curvilinear rather than linear
- c. **What preferences for smell and taste do infants have? Be able to tell by examples what an infant may perceive with smell and taste.**
 - Based on facial expressions, newborns prefer food flavorings (vanilla, strawberry) to stronger smells (fish, rotten eggs)
 - Newborns orient toward breast odor (eventually infants prefer odor of mother's breast to the odor of other lactating females)
 - Newborns suck more vigorously when fluids are sweetened.
 - Facial expression & muscular reactions differ for sweet and sour
 - lick lips and suck to sweet flavors
 - make "yuck" face to bitter and sour tastes
- d. **What are the reactions at different ages to the visual cliff? Why do babies react differently at different ages?**
 - Eleanor Gibson invented the visual cliff to study depth perception
 - Put 7-8 mo. baby in middle of cliff, put mother on deep or shallow side. Have mother call baby.
 - Findings: infants avoided deep side — CAN perceive depth
 -
 - Later research by Bertenthal
 - Younger than 7-8 mo. (pre-locomotive) infants were placed on the visual cliff
 - Findings: decrease in heart rate (shows interest, not fear)
 - FEAR of depth develops through experience with self-locomotion (infants with walker experience show more avoidance to deep side than those without)
- e. **What is the primary characteristic of perceptual development in childhood and adolescence, as discussed in class?**
 - General trend: Information processing is less perceptually dominated as we get older
- f. **What did The Cat in the Hat study suggest about auditory perception in infants, as discussed in class?**
 - Decasper and Spence found that fetuses can hear!
(mothers read "The Cat in the Hat" during the 9th mo. of pregnancy. After birth, babies sucked more to hear "The Cat in the Hat" than for other books)
- g. **How does perceptual development change as we get older in all domains?**
 - Increases in sensory thresholds — more energy is needed to detect a stimulus (sight, sound, smell)
