Harbeke, 2012-12-06

In terms of structure the field of semiconductors spans a wide range from the perfect order of single crystals to the non periodic disordered amorphous state The two extremes of this range attract a large amount of interest On one side glamorous novel phenomena are being found which can only occur in specially tailored ultra perfect periodic lattices On the other side the exotic and challenging nature of the amorphous state has triggered a surge of activity in recent years Polycrystalline semiconductors are in between They are among the work horses in the field useful in many applications a handy solution to many practical problems and still they have not received in the past the amount of research interest that they deserve It is the aim of the present book to improve this situation The book originated from the lectures and seminars presented at the course on Polycrystalline Semiconductors Physical Properties and Applications of the International School on Materials Science and Technology held at the Centre for Scientific Culture Ettore Majorana in Erice Italy July 1-15 1984 Nuclear Science Abstracts, 1966 *Circulars*, 1888
