Millar, D.A. Williams, 2012-12-06 An attempt has been made to collate the numbers of certain molecules in interstellar space A search for the bands of CH, O, DR, en and C₂ would appear to be promising P Swings and L Rosenfeld *Astrophysical Journal* 86 483 1937 This may have been the first attempt at modelling interstellar chemistry As with models today the methods used lacked reliability but the speculation was impressive Mark Twain might well have said of this infant subject One gets such wholesale returns of conjecture out of such a trifling investment of fact The detection of unidentified lines around the period that Swings and Rosenfeld were writing provoked much interest but even the most optimistic speculator could hardly have imagined developments which would occur during the next 50 years By 1987 about 70 varieties of molecule had been identified in the interstellar and circumstellar regions They range in complexity from simple diatomics such as H₂ and CO to such species as ethanol C₂H₅OH acetone CH₃CO and the largest interstellar molecule detected so far cyano penta acetylene HC₁₁N The study of these molecules in astronomy has developed enormously especially over the last 20 years and is now codified in the new subject of astrochemistry That such a variety of chemical species should exist in tenuous regions of the Galaxy is fascinating *Atmospheric Ozone as a Climate Gas* Wei-Chyung Wang, Ivar S.

Isaksen, 2013-06-29 One of the major findings in the 1992 IPCC report and the 1994 World Meteorological Organization's Ozone Assessment report was the identification of possible climatic effects over the last few decades resulting from anthropogenically induced changes in atmospheric ozone The initial quantitative estimates of their direct climatic effects indicate significant impacts though large uncertainties exist and studies using general circulation models are needed A point that needs to be addressed in particular is that atmospheric ozone differs from greenhouse gases in that it is formed and destroyed by chemical processes in the atmosphere due to interaction involving a large number of source gases e.g. H₂O, NO, CO₂, NMHC, NO_x, CH₄ and the CFCs Therefore the indirect effect of climate chemistry interaction involving atmospheric ozone is an important aspect for consideration in general circulation models During the last few years there have been several international workshops related to atmospheric ozone In 1987 a NATO workshop on atmospheric ozone was held in Lillehammer Norway More recently two workshops were organized to discuss the topic General Circulation Model Study of Climate Chemistry Interaction The first was held August 19-21 1992 in Oslo Norway and the second held May 26-27 1993 in Albany New York USA The two workshops were IAMAP activities under the Trace Constituent Working Group *The*
