Instruction That Measures Up W. James Popham, 2009-05-26 High stakes testing. Mandated content standards and benchmarks. Public scrutiny of student and school performance. Accountability. Teachers today are challenged to provide instruction that will measure up to the expectations of administrators, parents, and taxpayers to their own professional standards and most essentially to the needs of students. Policy debates rage in the press and pedagogical pundits always have a new and better solution to offer but inside the walls of the classroom instruction boils down to teachers deciding what they want their students to learn, planning how to promote that learning, implementing those plans, and then determining if the plans worked. And the best instructional decisions are informed by empirical research, assessment evidence, and the sound judgment of the professional educator. In this book, W. James Popham calls on his half-century in the classroom to provide a practical four-stage framework for guiding teachers through their most important instructional decisions: curriculum determination, instructional design, instructional monitoring, and instructional evaluation. Along the way, he emphasizes the critical ways in which assessment can and should influence instruction, advocates for a dash of curricular insurrection, and offers advice for maintaining both teaching excellence and teachers' sanity.

impairments to name a few Despite the widespread appreciation of the importance of such secondary factors on cognitive functioning in clinical neuropsychology there has never been a single source for this information that is readily available to clinicians and researchers The present volume provides such a source using an evidence based framework comprised of two broad sections The first section includes chapters that comprehensively address particular secondary influences independent of any particular neurological disorder For example there are chapters on the impact on cognitive functioning of depression anxiety fatigue pain diagnosis threat and symptom invalidity The second section has chapters that focus on specific neurological conditions and the most salient secondary factors that need to be considered in these conditions Multiple Sclerosis HIV Parkinson s Disease Traumatic Brain Injury Alzheimer s Disease MCI Stroke and Epilepsy are all considered The chapters include vivid case studies that illustrate the principles outlined in the chapters to help clinicians consider how such principles can apply to particular patients Chapters also include evidence based guidelines for clinical practice The final chapter highlights some areas especially in need of further research and study that will be of particular interest and importance to clinicians
