Knowledge-based Expert Systems in Chemistry Philip Judson, 2009 This is currently the only book available on the development of knowledge based and related expert systems in chemistry and toxicology Written by a pioneer in the field it shows how computers can work with qualitative information where precise numerical methods are not satisfactory An underlying theme is the current concern in society about the conflicts between basing decisions on reasoned judgements and wanting precise decisions and measurable effectiveness As well as explaining how the computer programs work the book provides insights into how personal and political factors influence scientific progress The introduction of regulations such as REACH in Europe and modifications to UN and OECD Guidelines on assessment of chemical hazard mean that the use of toxicity prediction is at a turning point They put a heavy burden on the chemical industry but for the first time allow for the use of computer prediction to support or replace in vivo and in vitro experiments There is increasing recognition among scientists and regulators that qualitative computer methods have much to offer and that in some circumstances they may be more reliable and informative than quantitative methods This excellent introduction to a field where employment opportunities are growing is aimed at students scientists and academics with a knowledge of chemistry
