A coin is tossed and a six-sided die is rolled. Find the probability of getting a head on the coin and a 6 on the die.

> These two events (the coin and die) are independent events because the flipping of the coin does not affect rolling the die. The events are independent of each other.

Solution:

Let's find the probability of each independent event:

$P(\text{heads}) = \dfrac{1}{2}$ There is only 1 head on a coin.
There are two total outcomes (heads or tails)

$P(6) = \dfrac{1}{6}$ There is only one 6 on a die.
There are 6 total outcomes on a die (1,2,3,4,5,6)

Now we need to find the probability of tossing a head on the coin and rolling a 6 on the die. So, we need to combine both events. There's a special rule for calculating the probability of independent events.

> To find the probability of two or more independent events that occur in sequence, find the probability of each event separately, and then multiply the answers.
>
> $$P(A \text{ and } B) = P(A) \cdot P(B)$$

Now, let's apply our new rule:

$P(\text{heads and a 6}) = \dfrac{1}{2} \cdot \dfrac{1}{6} = \dfrac{1}{12}$

The probability of flipping a head on the coin and rolling a 6 on the die is 1/12.

Questionnaires provided verbal data of nine participants enrolled in a college finite mathematics course while solving problems containing simple compound independent and dependent probabilistic events Overall the general method modeled by the more successful students consisted of the student reading the entire problem including the question breaking down the problem into sections analyzing each section separately using the context of the question to reason a solution and checking the final answer However this ideal method was not always successful While some less successful students tried to use this approach when solving their problems their inability to work with percents and fractions to organize and analyze data within their own representation Venn diagram tree diagram table or formula and to relate the process of solving word problems to the context of the problem hindered their success solving the problem In addition the more successful student exhibited the discipline to attend the class to try their homework problems throughout the section on probability and to seek outside help when they did not understand a problem However students did try alternate unsuccessful methods when attempting to solve probability problems While one student provided answers to the problems based on his personal experience with the situation other students sought key words within the problem to prompt them to use a correct representation or formula without evidence of the student trying to interpret the problem While most students recognized dependent events they encountered difficulty stating the probability of a dependent event due to their weakness in basic counting principles to find the size of the sample space For those students who had not encountered probability problems before the first questionnaire some students were able to make connections between probability and percent Finally other inexperienced students encountered difficulty interpreting the terminology associated with the problems solving the problem based on their own interpretations
