Optimization Methods in Electromagnetic Radiation Thomas S. Angell, Andreas Kirsch, 2006-05-11 The subject of antenna design, primarily a discipline within electrical engineering, is devoted to the manipulation of structural elements of and/or the electrical currents present on a physical object capable of supporting such a current. Almost as soon as one begins to look at the subject, it becomes clear that there are interesting mathematical problems which need to be addressed in the first instance simply for the accurate modelling of the electromagnetic fields produced by an antenna. The description of the electromagnetic fields depends on the physical structure and the background environment in which the device is to operate. It is the coincidence of a class of practical engineering applications and the application of some interesting mathematical optimization techniques that is the motivation for the present book. For this reason, we have thought it worthwhile to collect some of the problems that have inspired our research in applied mathematics and to present them in such a way that they may appeal to two different audiences: mathematicians who are experts in the theory of mathematical optimization and who are interested in a less familiar and important area of application, and engineers who confronted with problems of increasing sophistication are interested in seeing a systematic mathematical approach to problems of interest to them. We hope that we have found the right balance to be of interest to both audiences. It is a difficult task. Our ability to produce these devices at all, most designed for a particular purpose, leads quite soon to a desire to optimize.

the design in various ways The mathematical problems associated with attempts to optimize performance can become quite sophisticated even for simple physical structures
