Reactive Flows, Diffusion and Transport Willi Jäger, Rolf Rannacher, J. Warnatz, 2007-05-31 The articles in this volume summarize the research results obtained in the former SFB 359 Reactive Flow Diffusion and Transport which has been supported by the DFG over the period 1993-2004. The main subjects are physical-chemical processes sharing the difficulty of interacting diffusion, transport, and reaction, which cannot be considered separately. Typical examples are the chemical processes in flow reactors and in the catalytic combustion at surfaces. Further examples are models of star formation including diffusive mass transport, energy radiation, and dust formation, and the polluting transport in soil and waters. For these complex processes, mathematical models are established and numerically simulated. The modeling uses multiscale techniques for nonlinear differential equations, while for the numerical simulation and optimization, goal-oriented mesh and model adaptivity, multigrid techniques, and advanced Newton-type methods are developed, combined with parallelization. This modeling and simulation is accompanied by experiments. *Student's Solutions Manual for Finite Mathematics and Its Applications* Renato Mirollo, Larry Joel Goldstein, Salvatore Sciandra, David I.
