Complete Note Collection Carsten Borgen, 2020-04-02 In its 6th edition The Airline Transport Pilot Complete Note Collection book is a culmination of more than 10 years of research and writing What started out as a personal note collection for my ATPL studies later became a compilation of information benefiting pilots around the world If you have acquired this book it means you are interested in being the best pilot you can possibly be Being the best pilot requires a continuously never ending dedication to learning and revising from the time you first step into the classroom till the day you retire from aviation As we aspire to become better and safer we must never forget the knowledge and skills we have already acquired Carsten Borgen You will be familiar with most of the information in this book but over time that information will slowly fade away As a professional pilot it is crucial to keep this knowledge sharp but going through all the ATPL subject publications again and again would be an endless task This book is written as a quick reference guide to pilots and aviation enthusiasts in an effort to simplify the process of staying current and revising the theory you have already learned while adding to that knowledge Using this book you can within a couple of hours revise a complete subject matter Whether you have acquired this book to remain current or simply to prepare for exams or interviews this book will stay with you for the rest of your career

Polarity-Dependent Removal Interferences in Sink EDM of Titanium Alloys
Maximilian Holsten, 2018-12-31 In the design of turbomachinery components a significant effort is carried

out regarding the optimization of efficiency The increase in thermal efficiency particularly involves the introduction of high performance alloys Such alloys are for example titanium alloys Sink electrical discharge machining sink EDM is a crucial manufacturing process for components due to its independence of machined material strengths however new materials require process design Hence research to understand and optimize the machining of titanium alloys is of great benefit to the industry in general A positive tool polarity is generally adopted in sink EDM to maximize material removal relative to tool wear Sink EDM of titanium alloys as Ti6Al4V is however atypical in that these materials necessitate a negative tool polarity Adding to the intrigue are gamma titanium aluminides TiAl which machine better under the conventional positive polarity Established explanatory models of sink EDM fail in resolving the removal behavior a need for fundamental research is given This thesis focuses on clarifying the phenomena behind this interesting behavior by investigating removal mechanisms over a range of relevant process conditions The polarity effect is demonstrated to arise from the polarity dependent nature and extent of titanium carbide TiC formation on the workpiece surface which significantly affects material removal mechanisms An explanatory model deduced from different experimental and numerical approaches clarifies the influence of polarity to the formation mechanism of a TiC layer With regard to monitoring of adverse layer formations the measurement of acoustic emission AE is proven an appropriate concept A correlation of the AE signal to process forces is even established which may be crucial to determine the deflection of thin electrodes in EDM Finally the knowledge acquired is applied and enhanced in comprehensive process design that also involves the machining of additively manufactured TiAl The study reveals the beneficial behavior of the fine microstructure relative to the resulting surface integrity As a result this thesis delivers a model based concept for process design with respect to the adequate choice of tool polarity during machining of titanium alloys
