

# Cochran's Sample Size Formula

- The Cochran formula allows to calculate an ideal sample size given a desired level of precision, desired confidence level, and the estimated proportion of the attribute present in the population.
- Cochran's formula is considered especially appropriate in situations with large populations. A sample of any given size provides more information about a smaller population than a larger one, so there's a 'correction' through which the number given by Cochran's formula can be reduced if the whole population is relatively small.

- The Cochran formula is:

$$n_0 = \frac{Z^2 pq}{e^2}$$

Where:  $e$  is the desired level of precision (i.e. the margin of error),

$p$  is the (estimated) proportion of the population which has the attribute in question,

$q$  is  $1 - p$ .

The  $z$  value is found in a  $Z$  table.

Schrage, 2012-12-06 Simulation means driving a model of a system with suitable inputs and observing the corresponding outputs It is widely applied in engineering in business and in the physical and social sciences Simulation methodology draws on computer science statistics and operations research and is now sufficiently developed and coherent to be called a discipline in its own right A course in simulation is an essential part of any operations research or computer science program A large fraction of applied work in these fields involves simulation the techniques of simulation as tools are as fundamental as those of linear programming or compiler construction for example Simulation sometimes appears deceptively easy but perusal of this book will reveal unexpected depths Many

simulation studies are statistically defective and many simulation programs are inefficient We hope that our book will help to remedy this situation It is intended to teach how to simulate effectively A simulation project has three crucial components each of which must always be tackled 1 data gathering model building and validation 2 statistical design and estimation 3 programming and implementation Generation of random numbers Chapters 5 and 6 pervades simulation but unlike the three components above random number generators need not be constructed from scratch for each project Usually random number packages are available That is one reason why the chapters on random numbers which contain mainly reference material follow the chapters dealing with experimental design and output analysis

**Sampling Methods** Pascal Ardilly, Yves Tillé, 2006-02-08 When we agreed to share all of our preparation of exercises in sampling theory to create a book we were not aware of the scope of the work It was indeed necessary to compose the information type out the compilations standardise the notations and correct the drafts It is fortunate that we have not yet measured the importance of this project for this work probably would never have been attempted In making available this collection of exercises we hope to promote the teaching of sampling theory for which we wanted to emphasise its diversity The exercises are at times purely theoretical while others are originally from real problems enabling us to approach the sensitive matter of passing from theory to practice that so enriches survey statistics The exercises that we present were used as educational material at the cole Nationale de la Statistique et de l'Analyse de l'Information ENSAI where we had successively taught sampling theory We are not the authors of all the exercises In fact some of them are due to Jean Claude Deville and Laurent Wilms We thank them for allowing us to reproduce their exercises It is also possible that certain exercises had been initially conceived by an author that we have not identified Beyond the contribution of our colleagues and in all cases we do not consider ourselves to be the lone authors of these exercises they actually form part of a common heritage from ENSAI that has been enriched and improved due to questions from students and the work of all the demonstrators of the sampling course at ENSAI

**Selection Methods in Plant Breeding** Izak Bos,Peter Caligari,1995-08-31 Our requirement for plant breeders to be successful has never been greater However one views the forecasted numbers for future population growth we will need in

the immediate future to be feeding clothing and housing many more people than we do inadequately at present Plant breeding represents the most valuable strategy in increasing our productivity in a way that is sustainable and environmentally sensitive Plant breeding can rightly be considered as one of the oldest multidisciplinary subjects that is known to humans It was practised by people who first started to carry out a settled form of agriculture The art as it must have been at that stage was applied without any formal underlying framework but achieved dramatic results as witnessed by the forms of cultivated plants we have today We are now learning how to apply successfully the results of yet imperfect scientific knowledge This knowledge is however rapidly developing particularly in areas of tissue culture biotechnology and molecular biology Plant breeding's inherent multifaceted nature means that alongside obvious subject areas like genetics we also need to consider areas such as statistics physiology plant pathology entomology biochemistry weed science quality seed characteristics reproductive biology trial design selection and computing
