

Regulating the Cell Cycle

Abstract: In this paper, we study the asymptotic behavior of the spectral gap of the Laplacian of a graph with a fixed number of vertices and a fixed number of edges. We show that the spectral gap is bounded below by a constant depending only on the number of vertices and the number of edges.

Systems Biology of Transcription Regulation Ekaterina Shelest, Edgar Wingender, Joerg Linde, 2016-09-09 Transcription regulation is a complex process that can be considered and investigated from different perspectives Traditionally and due to technical reasons including the evolution of our understanding of the underlying processes the main focus of the research was made on the regulation of expression through transcription factors TFs the proteins directly binding to DNA On the other hand intensive research is going on in the field of chromatin structure remodeling and its involvement in the regulation Whatever direction we select we can speak about several levels of regulation For instance concentrating on TFs we should consider multiple regulatory layers starting with signaling pathways and ending up with the TF binding sites in the promoters and other regulatory regions However it is obvious that the TF regulation also including the upstream processes represents a modest portion of all processes leading to gene expression For more comprehensive description of the gene regulation we need a systematic and

holistic view which brings us to the importance of systems biology approaches Advances in methodology especially in high throughput methods result in an ever growing mass of data which in many cases is still waiting for appropriate consideration Moreover the accumulation of data is going faster than the development of algorithms for their systematic evaluation Data and methods integration is indispensable for the acquiring a systematic as well as a systemic view In addition to the huge amount of molecular or genetic components of a biological system the even larger number of their interactions constitutes the enormous complexity of processes occurring in a living cell organ organism In systems biology these interactions are represented by networks Transcriptional or more generally gene regulatory networks are being generated from experimental ChIPseq data by reverse engineering from transcriptomics data or from computational predictions of transcription factor TF target gene relations While transcriptional networks are now available for many biological systems mathematical models to simulate their dynamic behavior have been successfully developed for metabolic and to some extent for signaling networks but relatively rarely for gene regulatory networks Systems biology approaches provide new perspectives that raise new questions Some of them address methodological problems others arise from the newly obtained understanding of the data These open questions and problems are also a subject of this Research Topic

Biology of the Fungal Cell Richard J. Howard, Neil A.R. Gow, 2013-03-09 Biology of the Fungal Cell offers a select sampling of current knowledge and direction of fundamental research into the cellular structure morphogenesis and development of fungi Topics range from the mechanisms of invasive growth and controls of polarity to the nature of extracellular matrices and the various connections through the cell wall to the cytoskeleton and beyond The fungal cell is considered in the context of colony formation as well as from a molecular point of view from signal transduction to the vast tubular matrix that comprises the vacuole system with an over riding emphasis on biology The volume concludes with a forward looking consideration of genomics as perhaps the most powerful tool available for studies of the fungal cell Each chapter some lavishly illustrated authored by highly respected scientists in the field offers an in depth review of the subject that is key to a basic understanding on how these organisms develop as cells colonies and pathogens Progress in Cell Cycle Research Laurent Meijer, Silvana Guidet, Michel Philippe, 2012-12-06 The Progress in Cell Cycle Research series has been conceived to serve as a collection of reviews on various aspects of a fast growing biology field the cell division cycle These reviews do not pretend to cover all aspects of cell cycle regulation and mechanisms but rather focus on a few topics of particular interest in the recent literature This third volume starts with a broad overview of the diversity of ways by which viruses subdue their host cell cycle chapter 1 Of particular interest in this area is the case of HN which has recently been extensively investigated chapter 2 Although most of our understanding of cell cycle regulation derives from work performed in yeast and animal cells plant models reviewed in chapter 3 for one of the best studied example Arabidopsis are starting to contribute significantly to the cell cycle general picture In mammals the regulation of cell division of two types of tissues the intestine chapter 4 and the developing muscle chapter 5 are investigated in an interesting physiological context Cell division is accompanied by a number of morphological changes One of them organelle transport is starting to be better understood chapter 6 The next few chapter summarise our knowledge of some essential regulators of the cell cycle A still intriguing enzyme casein kinase 2 is reviewed in detail in chapter 7 Some of the most studied cell cycle regulators are certainly the CKI s cyclin dependent kinases inhibitors chapter 8
