Inside and Out Robert Forrant, Linda Silka, 2017-03-02 Two overarching questions permeate the literature on universities and civic engagement How does a university restructure its myriad activities maintain its academic integrity and have a transformative impact off campus And who ought to participate in the conversations that frame and guide both the internal restructuring process and the off campus interactions The perspective of this book based on research and projects in the field is that long term sustainable social and economic development requires strategies geared to the scientific technical cultural and environmental aspects of development Much of the work in this volume challenges traditional university practices Universities tend to reproduce a culture that rejects direct interaction across traditional academic department boundaries and beyond the campus Yet interdisciplinary work is important because it more aptly mirrors what is taking place in the regional economy as firms collaborate across manufacturing boundaries and community organizations and neighbourhood groups work to solve common problems What is distinctive within the range of scholarship and practice in this volume is the inclination on the part of increasing numbers of professors on more and more campuses to collaborate across disciplinary lines Universities must persist in the advancement of cross community cross firm and cross institutional learning The learning dynamics and knowledge diffusion generated by collaborative activities and new approaches to teaching can invigorate all phases of learning at the university In this way the university advances its activities beyond an indiscriminate approach to development maximizes the use of its resources and performs an integrative and innovative role

in the cultivation of equitable and sustainable regions The chapters in this book illustrate the strikingly different and exciting ways in which universities pursue education for sustainability Exemplary Science in Grades 9-12 Robert Eugene Yager,2005 Essay titles reveal the range of programs and creativity this book encompasses The book ends with a summary chapter on successes and continuing challenges in meeting the Standards visions for improving high school science

Hensel,2023-07-03 Co published with the Council on Undergraduate Research Undergraduate research has long been recognized as a high impact practice HIP but has unfortunately been offered only to juniors and seniors and to very few of them often in summer programs This book shows how to engage students in authentic research experiences built into the design of courses in the first two years thus making the experience available to a much greater number of students Research that is embedded in a course especially general education courses addresses the issue of how to expand undergraduate research to all students Research has shown that students who have early experiences in undergraduate research are more likely to pursue further research prior to and after graduation This is also an issue of social justice because it makes the benefits of undergraduate research available to students who must work during the academic year and in the summer It is widely accepted that the skills developed through undergraduate research help prepare students for their future careers The book addresses all aspects of the topic including What are appropriate expectations for research in the first two years How to design appropriate course based research for first and second year students How to mentor a class rather than individual students How students can disseminate the

results of their research Possible citizen science projects appropriate for the first and second years Providing additional resources available to support course based research in the first two years Designed for faculty at four year and two year colleges and including examples from the sciences the social sciences and the humanities the strategies and methods described can be adapted to disciplines not specifically mentioned in the book Many faculty are hesitant to engage first and second year students in undergraduate research because they worry students don t know enough to conduct authentic research in their discipline because they worry about the time it will take to develop activities for these students and because they wonder how they can mentor a whole class of students doing research The authors have successfully dealt with these issues and provide examples of how it s done *Curriculum by Design* Mary Thomas Crane, David Quigley, Andy Boynton, 2023-05-16 This book tells the story of how a team of colleagues at Boston College took an unusual approach working with a design consultancy to renewing their core and in the process energized administrators faculty and students to view liberal arts education as an ongoing process of innovation It aims to provide insight into what they did and why they did it and to provide a candid account of what has worked and what has not worked Although all institutions are different they believe their experiences can provide guidance to others who want to change their general education curriculum or who are being asked to teach core or general education courses in new ways The book also includes short essays by a number of faculty colleagues who have been teaching in BC s new innovative core courses providing practical advice about the challenges of trying interdisciplinary teaching team teaching project or problem based learning intentional reflection and other new structures and pedagogies for the first time It will also address some of the nuts and bolts issues they have encountered when trying to create structures to make curriculum change sustainable over time and to foster ongoing innovation *Original Strategies for Training and Educational Initiatives in Bioinformatics* Hugo Verli, Raquel Cardoso de Melo Minardi, 2022-10-07 Systems Thinking Cliff Whitcomb, Heidi Davidz, 2021-01-20 This Systems Thinking Special Issue contains 12 papers on the nature of systems thinking as it applies to systems engineering systems science system dynamics and related fields Systems thinking can be broadly considered the activity of thinking applied in a systems context forming a basis for fundamental approaches to several systems disciplines including systems engineering systems science and system dynamics Although these are somewhat distinct fields they are bound by common approaches in regard to systems Whereas systems engineering seeks to apply a multidisciplinary holistic approach to the development of systems systems science seeks to understand the basics related to systems of all kinds from natural to man made and system dynamics seeks to understand system structures in order to influence its dynamics Man made systems have become more ubiquitous and complex The study of systems both natural and engineered presents new challenges and opportunities to understand emergent dynamic behaviors that inform the process of sense making based on systems thinking Discovery-Based Learning in the Life Sciences Kathleen M. Susman, 2015-06-30 For nearly a decade scientists educators and policy makers

have issued a call to college biology professors to transform undergraduate life sciences education As a gateway science for many undergraduate students biology courses are crucial to addressing many of the challenges we face such as climate change sustainable food supply and fresh water and emerging public health issues While canned laboratories and cook book approaches to college science education do teach students to operate equipment make accurate measurements and work well with numbers they do not teach students how to take a scientific approach to an area of interest about the natural world Science is more than just techniques measurements and facts science is critical thinking and interpretation which are essential to scientific research Discovery Based Learning in the Life Sciences presents a different way of organizing and developing biology teaching laboratories to promote both deep learning and understanding of core concepts while still teaching the creative process of science In eight chapters the text guides undergraduate instructors in creating their own discovery based experiments The first chapter introduces the text delving into the necessity of science education reform The chapters that follow address pedagogical goals and desired outcomes incorporating discovery based laboratory experiences realistic constraints on such lab experiments model scenarios and alternate ways to enhance student understanding The book concludes with a reflection on four imperatives in life science research climate food energy and health and how we can use these laboratory experiments to address them Discovery Based Learning in the Life Sciences is an invaluable guide for undergraduate instructors in the life sciences aiming to revamp their curriculum inspire their students and prepare them for careers as educated global citizens
