Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and a training group. The control group consisted of 10 men who did not participate in any physical activity during the study. The training group consisted of 10 men who participated in a 10-week training program. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed at a heart rate of 150 beats per minute. The HR and HRR were measured at the beginning and end of the study. The results showed that the training group had a significantly higher HR and HRR at the end of the study compared to the control group. This suggests that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) and (c) paragraphs, repeat the analysis with the original data. The editor will be notified.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or natural light at night. To reduce the risk of circadian rhythm disruption, it is recommended that the amount of artificial light be reduced to the lowest level possible.
- Artificial lights that emit red light with a wavelength of 620 nm or longer are recommended, as the light is less likely to disrupt the circadian rhythm.
- The use of artificial light at night is discouraged, as it may increase the risk of circadian rhythm disruption. If artificial light is necessary, it should be used at the lowest possible level.
- Natural light is recommended for the treatment of circadian rhythm disorders. Natural light is available throughout the day, and it is the most natural light source.
