Numerical Methods and Optimization Éric Walter, 2014-07-22 Initial training in pure and applied sciences tends to present problem solving as the process of elaborating explicit closed form solutions from basic principles and then using these solutions in numerical applications This approach is only applicable to very limited classes of problems that are simple enough for such closed form solutions to exist Unfortunately most real life problems are too complex to be amenable to this type of treatment Numerical Methods a Consumer Guide presents methods for dealing with them Shifting the paradigm from formal calculus to numerical computation the text makes it possible for the reader to discover how to escape the dictatorship of those particular cases that are simple enough to receive a closed form solution and thus gain the ability to solve complex real life problems understand the principles behind recognized algorithms used in state of the art numerical software learn the advantages and limitations of these algorithms to facilitate the choice of which pre existing bricks to assemble for solving a given problem and acquire methods that allow a critical assessment of numerical results Numerical Methods a Consumer Guide will be of interest to engineers and researchers who solve problems numerically with computers or supervise people doing so and to students of both engineering and applied mathematics

Mathematical Modeling in Experimental Nutrition: Vitamins, Proteins, Methods, 1996-12-02

This book developed from a series of conferences to facilitate the application of mathematical modeling to experimental nutrition. As nutrition science moves from prevention of gross deficiencies to identifying requirements for optimum long term health, more sophisticated methods of nutritional assessment will be needed. Collection and evaluation of kinetic data may be one such method. This book opens with chapters giving specific examples of the application of modeling techniques to vitamin A, carotenoids, folate, vitamin B₆, glycogen phosphorylase, transthyretin, amino acids and energy metabolism. Obtaining kinetic data on internal processes is a major challenge; therefore the text includes chapters on the use of microdialysis and ultrafiltration, use of membrane vesicles and culture of mammary tissue. Many of the authors use the Simulation Analysis and Modeling program which allows compartmental models to be described without specifying the required differential equations. The final sections of the book however present some more mathematical descriptions of physiological processes including bioperiodicity, metabolic control and membrane transport. Discussions of some computational aspects of modeling such as parameter distributions, linear integrators and identifiability and alternative mathematical approaches such as neural networks and graph theory. Specific detailed examples of applications of modeling to vitamins, proteins, amino acids and energy metabolism. Novel methods for collecting kinetic data: microdialysis, ultrafiltration, membrane vesicles and the culture of mammary tissue. Mathematical treatment of complex metabolic processes including bioperiodicity, metabolic control and membrane transport. Computational approaches to distribution of kinetic parameters, evaluation of linear integrators and identifiability. Alternative mathematical approaches: neural networks and graph theory. Detailed descriptions of the application of modeling to a variety of nutrients.
