

Periodic Trends Practice

Atomic Radius

The distance from the nucleus of one bonded atom.

Electronegativity

How much an atom "wants" electrons or the atom's tendency to attract electrons.

Ionization Energy

The amount of energy required to remove electrons from an atom.

Electron Affinity

The amount of energy released when a neutral gaseous atom gains an electron.

Driving Question

How can the periodic table be used to predict atomic characteristics such as atomic radius, electronegativity, ionization energy, and electron affinity?

Describe what causes this trend...

As you move from left to right across a period, the number of protons increases, which increases the positive charge of the nucleus. This increases the attraction for electrons, which decreases the atomic radius.

As you move from left to right across a period, the number of protons increases, which increases the positive charge of the nucleus. This increases the attraction for electrons, which decreases the atomic radius.

Shielding?

What is shielding? What effect does it have on the periodic trends defined above?

Shielding occurs when inner electrons block out the positive pull of the nucleus on outer electrons. The more shielding there is, the more atomic radius increases, electronegativity decreases, ionization energy decreases, and electron affinity decreases.

Add arrows to each of the following periodic tables to indicate the direction of the trend as it increases or decreases from left to right and top to bottom. *For Fig. 1 use a different color for each of the periodic tables so you can easily remember them.
