Computational Modelling of Concrete and Concrete Structures Günther Meschke, Bernhard Pichler, Jan G. Rots, 2022-05-22 Computational Modelling of Concrete and Concrete Structures contains

the contributions to the EURO C 2022 conference Vienna Austria 23-26 May 2022. The papers review and discuss research advancements and assess the applicability and robustness of methods and models for the analysis and design of concrete fibre reinforced and prestressed concrete structures as well as masonry structures. Recent developments include methods of machine learning, novel discretisation methods, probabilistic models and consideration of a growing number of micro structural aspects in multi scale and multi physics settings. In addition, trends towards the material scale with new fibres and 3D printable concretes and life cycle oriented models for ageing and durability of existing and new concrete infrastructure are clearly visible. Overall computational robustness of numerical predictions and mathematical rigour have further increased, accompanied by careful model validation based on respective experimental programmes. The book will serve as an important reference for both academics and professionals stimulating new research directions in the field of computational modelling of concrete and its application to the analysis of concrete structures.

EURO C 2022 is the eighth edition of the EURO C conference series after Innsbruck 1994, Bad Gastein 1998, St Johann im Pongau 2003, Mayrhofen 2006, Schladming 2010, St Anton am Arlberg 2014 and Bad Hofgastein 2018. The overarching focus of the conferences is on computational methods and numerical models for the analysis of concrete and concrete structures.

Structural Connections for Precast Concrete Buildings fib Fédération internationale du béton, 2008-01-01. Connections are among the most essential parts in precast structures. Their performance relates to the structural limit states as well as to manufacture of the precast elements and erection and maintenance of the structure itself. Proper design of connections is one major key to a successful prefabrication. The principal aim of fib Bulletin 43 is to encourage good practice in the design of structural connections in precast concrete structures. This is achieved through a good understanding of structural connections as parts of the overall structural system and of basic force transferring mechanisms. The bulletin consists of two parts: the first part concerns general considerations and philosophy in the design of structural connections and the second part deals with basic force transferring mechanisms within structural connections. The main focus is on the design of structural connections with regard to their structural function in ordinary design situations in the serviceability and ultimate limit states and in accidental/abnormal design situations like fire, lack of fit and impact, accidental loads. Other aspects considered include production handling and site erection of elements, building physics, durability and maintenance. Bulletin 43 applies to structural connections for precast concrete buildings, although the information on basic force transfer mechanisms can also be applicable to other types of prefabricated structures.
