

Vectors are the same if they have the same direction and magnitude.

A negative vector has the same magnitude but is in the opposite direction.

A vector can be multiplied by a scalar to make it shorter or longer or reverse the direction.

Vectors can be added together to create a pathway from one point to another.

$$\overline{AC} = a + b$$

Two vectors are parallel if one is a multiple of the other.

effective methods for data mining and knowledge discovery DM KD to which the present book is devoted grows every day and numerous such methods have been developed in recent decades There exists a great variety of different settings for the main problem studied by data mining and knowledge discovery and it seems that a very popular one is formulated in terms of binary attributes In this setting states of nature of the application area under consideration are described by Boolean vectors defined on some attributes That is by data points defined in the Boolean space of the attributes It is postulated that there exists a partition of this space into two classes which should be inferred as patterns on the attributes when only several data points are known the so called positive and negative training examples The main problem in DM KD is defined as finding rules for recognizing classifying new data points of unknown class i.e. deciding which of them are positive and which are negative In other words to infer the binary value of one more attribute called the goal or class attribute To solve this problem some methods have been suggested which construct a Boolean function separating the two given sets of positive and negative training data points
