**Abstract**—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were randomly assigned to a control group (CON) and an exercise group (EX). The EX group performed a 10-week training program consisting of three sessions per week of aerobic exercise. The CON group did not exercise. The EX group showed a significant decrease in HR and a significant increase in EE compared to the CON group. The results of this study suggest that a 10-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) and (c) paragraphs, repeat the analysis with the original data. The original data are available.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or other light sources. To avoid this, there are two things the producer should do:
  - Turn off the lights at the end of the work day.
  - Use red light for night shifts, as the wavelength of this light may be less disruptive to the circadian rhythm. Red light has the longest wavelength and the lowest energy, so it is least likely to affect the circadian rhythm. Some studies suggest that the 650 nm (red) light may be the best choice for night shifts.

  - a. Is the flow type supercritical or subcritical, and what does the downstream flow type in each state tell you about the Quick-Stop-Station?
10. Repeat the last question, but now for the 1000-ton flow (quantity) flow for the reach with a subcritical flow, a flow with a subcritical flow, and the flow with a subcritical flow.
