measurements is ensured through effective calibration and the choice of sensors has varied through the study with earlier sensors suffering from more drift than the current sensors Belcastro 2009 and Schrader 2013 In flight parameter data collected includes left and right wing and angles roll pitch yaw angles and corresponding rates all control surface deflections vertical speeds altitude losses and the aeroplane s accelerations in all three directions Such data have been statistically analysed The pitch behaviour has been mathematically modelled on the basis of the gathered flight test data Nine observations have been proposed These mainly cover the effects of centre of gravity and aircraft mass variations on spin characteristic behaviour They have all been proven as true through the results of this thesis The final observation concerns the generalisation of the Fuji results to the spin behaviour of other aircraft in the same category These observations can be used to improve flight test programmes aircraft design processes flight training materials and hence contribute strongly to better flight safety
