## Effective composition of ocean water determined by:

- 1) salinity - given defined by mass percentage of water which depends on the amount of water which has evaporated or which has precipitated
- 2) total - water moving through salt balance from evaporation/precipitation and from inflow/outflow of water
- 3) biological processes - phytoplankton consumption of CO<sub>2</sub> and release of O<sub>2</sub> and other gases

## Effective salinity and density as a function of:

- 1) temperature - water expands as temperature increases
- 2) composition - water expands as composition changes

## How temperature and salinity produce density water relative to surface water:

### Temperature differences alone cause density:

- 1) warm water is less dense than cold water
- 2) warm, less dense water is floating on a colder, denser water mass
- 3) when the temperature difference is large, the density difference is sufficient to cause the water to sink

### Salinity differences cause density:

- 1) water with higher salinity is denser than water with lower salinity
- 2) water with higher salinity, and lower temperature, floats above water with higher salinity
- 3) density is greater for water with higher salinity and lower temperature
- 4) the higher the salinity, the more likely it is to sink as the temperature increases

## Notes:

1) The region of the ocean that is most dense is found in the North Atlantic.

### Temperature effects:

1) The North Atlantic is the warmest water mass in the world.

### Salinity effects: 1) The North Atlantic is the saltiest water mass in the world.

### Notes: 1) The North Atlantic is the warmest water mass in the world.

2) The North Atlantic is the saltiest water mass in the world.
