

Introduction to Organic chemistry

Organic chemistry is the branch of chemistry that studies **carbon** compounds present in **living** things, **once** living things or **synthetic**/man-made.

Compounds that makes up living things whether alive or dead mainly contain carbon.

Carbon is **tetravalent**.

It is able to form stable **covalent** bonds with **itself** and many **non-metals** like hydrogen, nitrogen, oxygen and halogens to form a variety of compounds.

This is because: (i) carbon uses all the four valence electrons to form four strong covalent bond.

(ii)carbon can covalently bond to form a single, double or triple covalent bond with itself. This is called **Catenation**

(iii)carbon atoms can covalently bond to form a very long chain or ring.

When carbon covalently bond with Hydrogen, it forms a group of organic compounds called

Hydrocarbons
