

Physical Geology Study Guide for Exam 4

It is recommended that you bring your own pencils for the exam. If you do not have pencils, then you will be asked to provide your own for the exam. This study guide should be used as a reference for the exam. The study guide should be used as a reference for the exam. The study guide should be used as a reference for the exam. The study guide should be used as a reference for the exam.

Answer the following questions:

- 1.1 Describe the hydrologic cycle, components, and processes. The hydrologic cycle is a continuous process that moves water around the planet. It is driven by the sun, which provides the energy for evaporation. Water evaporates from the ocean, lakes, and rivers, and from plants. The water vapor then condenses into clouds. When the clouds become heavy enough, they release precipitation in the form of rain or snow. The water then flows back to the ocean, lakes, and rivers, or it infiltrates the ground and becomes groundwater. The hydrologic cycle is a complex system that involves many different processes, and it is essential for life on Earth.
- 1.2 Define erosion, and the following erosion parts: runoff, channels, meanders, oxbow lakes, and floodplains. Erosion is the process of wearing away the Earth's surface. It is caused by the movement of water and wind. Runoff is the water that flows over the land surface. Channels are the paths that water flows through. Meanders are the curves in a river. Oxbow lakes are bodies of water that have been cut off from a river. Floodplains are the areas of land that are flooded by a river.
- 1.3 Define drainage basin and divide. A drainage basin is the area of land that drains water into a single body of water. A divide is the line that separates two drainage basins.
- 1.4 Define drainage patterns: dendritic, radial, rectangular, and trellis. Dendritic drainage patterns are the most common. They are characterized by a main channel with many smaller tributaries. Radial drainage patterns are found on volcanic cones. Rectangular drainage patterns are found in areas with jointed rock. Trellis drainage patterns are found in areas with alternating hard and soft rock.
- 1.5 Describe how erosion, transportation, and deposition are affecting the Grand Canyon and the Colorado Plateau. The Grand Canyon is a large, deep, and narrow gorge that has been carved by the Colorado River. The Colorado Plateau is a large, flat, and arid region in the southwestern United States. Erosion, transportation, and deposition are all processes that are shaping these landscapes.
- 1.6 Define alluvial fans, alluvial cones, and alluvial aprons. Alluvial fans are large, triangular-shaped deposits of sediment that form at the base of a mountain. Alluvial cones are smaller, cone-shaped deposits of sediment that form at the base of a mountain. Alluvial aprons are large, flat, and arid regions that are covered by a thin layer of sediment.
- 1.7 Describe how the Colorado River is affected by human activities. The Colorado River is a major water source for the southwestern United States. It is affected by human activities in many ways, including damming, irrigation, and urban development.
- 1.8 Describe the water resources in the southwestern United States. The southwestern United States is a dry region with limited water resources. The Colorado River is the primary source of water for the region. Other water resources include groundwater, surface water, and precipitation.
- 1.9 Define the different types of sedimentation: clastic, organic, and chemical. Clastic sedimentation is the process of sediment being transported by water or wind and then deposited. Organic sedimentation is the process of sediment being formed from the remains of plants and animals. Chemical sedimentation is the process of sediment being formed from the precipitation of minerals from a solution.

Physical Geology Study Guide Final Exam Answers
