Abstract

As the temperature decreases, the rate of molecular motion decreases and the particles "clump" together. The clumped material forms the solid and liquid phases. Finally the particles move so far apart that they no longer interact and a gas forms. The resulting sequence of states is called the *freezing* sequence. A phase transition sequence is a process in which a material first moves from the gas to the liquid to the solid, and then back to the gas. The reverse process, the *melting* sequence, takes place in the opposite direction. The two sequences are the same with respect to the energy involved, except that the energy is added in the melting sequence instead of removed in the freezing sequence. The two sequences are also the same with respect to the change in molecular motion. In the melting sequence, the particles go from the state of low molecular motion to the state of high molecular motion, and in the freezing sequence, the particles go from the state of high molecular motion to the state of low molecular motion.
