## Population dynamics

**Population dynamics**  
Introduction

**Understanding Population Dynamics**  
Population dynamics is the study of how and why the number of individuals in a population changes over time. It involves understanding the factors that influence birth rates, death rates, and migration.

**Birth Rates and Death Rates**  
Birth rates are the number of new individuals added to a population over a given period. Death rates are the number of individuals that die over the same period. The difference between birth and death rates determines whether a population is growing, stable, or declining.

**Population Growth**  
Population growth occurs when the birth rate is higher than the death rate. This can lead to exponential growth, where the population size increases rapidly over time.

**Population Stability**  
Population stability occurs when the birth rate is equal to the death rate. In this case, the population size remains constant over time.

**Population Decline**  
Population decline occurs when the death rate is higher than the birth rate. This can lead to a decrease in the population size over time.
