Permutation Design Kostas Terzidis, 2014-09-04 In design the problems that designers are called upon to solve can be regarded as a problem of permutations A permutation is an ordered arrangement of elements in a set In our case the set is design and the elements are design components such as lines shapes forms or spaces Traditionally such arrangements are done by human designers who base their decision making process either on intuition or on random sampling until a valid solution is found However in both cases the solution found may be an acceptable one but cannot be labeled as the best possible solution due to the subjective or arbitrary nature of the selection process In contrast by harnessing the potential of computational design these elements can be arranged in all possible ways and then the best ones are chosen based on specific criteria By presenting a complete list of permutation based arrangements the best solution will eventually reveal itself by excluding all other possible solutions This book comprehensively addresses theories techniques and examples of permutation design in order to fully demonstrate to the reader the full range of possibilities this method represents The significance of such an approach to design is enormous paradigmatic and far reaching It provides an alternative method for design analysis synthesis and evaluation that is based on computational force rather than pure human intelligence alone In contrast to human based random sampling or intuition permutation based design offers the assurance of an optimum design since any possible alternative design can be eliminated From a practical point of view this methodology offers a paradigmatic shift away from the current state of design practice where arbitrariness repetition and redundancy often exist From a theoretical viewpoint this new paradigm will offer alternative insights into the value of human creativity intuition and intelligence

exlibris Giovanni Corbellini, 2022-05-18 Architects write a lot especially now when conceptual aspects have become central in the advanced reflections and narrative forms increasingly intersect the quest of design practices for an ultimate legitimation In the growing mass of the publishing offer these keywords try to highlight recurrent issues tracking synthetic paths of orientation between different critical positions with particular attention to what happens in the neighbouring fields of the arts and sciences

Architecture for the Commons Jose Sanchez, 2020-08-04 Architecture for the Commons dives into an analysis of how the tectonics of a building is fundamentally linked to the economic organizations that allow them to exist By tracing the origins and promises of current technological practices in design the book provides an alternative path one that reconsiders the means of achieving complexity through combinatorial strategies This move requires reconsidering serial production with crowdsourcing and user content in mind The ideas presented will be explored through the design research developed within Plethora Project a design practice that explores the use of video game interfaces as a mechanism for participation and user design The research work presented throughout the book seeks to align with a larger project that is currently taking place in many different fields The Construction of the Commons By developing both the ideological and physical infrastructure the project of the Commons has become an antidote to current economic practices

that perpetuate inequality The mechanisms of the production and governance of the Commons are discussed inviting the reader to get involved and participate in the discussion The current political and economic landscape calls for a reformulation of our current economic practices and alternative value systems that challenge the current market monopolies This book will be of great interest not only to architects and designers studying the impact of digital technologies in the field of design but also to researchers studying novel techniques for social participation and cooperating of communities through digital networks The book connects principles of architecture economics and social sciences to provide alternatives to the current production trends

Art-Making as Problem-Solving Melvin Chen,2025-09-19 What is art making What is it in virtue of which an artifact counts as a work of art In this book Melvin Chen contends that art making is best understood in the context of problem solving Works of art are various ways in which artists solve problems and overcome obstacles while typically exhibiting creative thinking Using the theory of problem solving its theoretical milieu and various philosophical tools Chen builds a

robust coherent and consistent computationalist approach to art making and the production of works of art This computationalist approach to art making and the production of works of art in turn is articulated against the backdrop of an information theoretic philosophy of art This computationalist approach takes discussions in the philosophy of art into the twenty first century

Discrete Gilles Retsin, 2019-04-29 After two decades of experimentation with the digital the prevalent paradigm of formal continuity is being revised and questioned by an emerging generation of architects and theorists While the world struggles with a global housing crisis and the impact of accelerated automation on labour digital designers narrow focus on mere style and continuous differentiation seems increasingly out of touch This issue charts an emerging body of work that is based on a computational understanding of the discrete part or building block elements that are as scalable accessible and versatile as digital data The discrete proposes that a new digital understanding of assembly based on parts contains the greatest promise for a complex open ended adaptable architecture This approach capitalises on the digital economy and automation with the potential of the digital to democratise production and increase access The digital not only has deep implications for how we design and produce architecture it is first and foremost a new system of production with economic social and political consequences that need to be taken into account This issue presents a diverse body of work focused on the notion of the discrete from design experiments and aesthetics to urban models tectonics distributed robots new material organisations and post capitalist scenarios engaging with automation Contributors Viola Ago Mario Carpo Emmanuelle Chiappone Piriou Mollie Claypool Manuel Jimenez Garc a Daniel Koehler and Rasa Navasaityte Immanuel Koh Neil Leach Ryan Manning Philippe Morel M Casey Rehm Jose Sanchez Marrikka Trotter Manja van de Worp Maria Yablonina and Lei Zheng Featured Architects Kengo Kuma Lab eds Plethora Project MadM EZCT Eragatory and Studio Kinch
