Section 1 Study Human Populations:

Studying Human Populations Nicholas T. Longford, 2007-12-24 Studying Human Populations is a textbook for graduate students and research workers in social statistics and related subject areas It follows a novel curriculum developed around the basic statistical activities of sampling measurement and inference Statistics is defined broadly as making decisions in the presence of uncertainty that arises as a consequence of limited resources available for collecting information A connecting link of the presented methods is the perspective of missing information catering for a diverse class of problems that include nonresponse imperfect measurement and causal inference In principle any problem too complex for our limited analytical toolkit could be converted to a tractable problem if some additional information were available Ingenuity is called for in declaring such missing information constructively but the universe of problems that we can address is wide open not limited by a discrete set of procedures The monograph aims to prepare the reader for the career of an independent social statistician and to serve as a reference for methods ideas for and ways of studying human populations formulation of the inferential goals design of studies search for the sources of relevant information analysis and presentation of results Elementary linear algebra and calculus are prerequisites although the exposition is quite forgiving especially in the first few chapters Familiarity with statistical software at the outset is an advantage but it can be developed concurrently with studying the text

The History of Human

Populations P. M. G. Harris, 2001-07-30 From classic demographic theory to the best contemporary thinking this book will fruitfully replace previous ways of looking at population expansion and contraction The 50 years of scholarship that covers 2 1 2 millennia peoples in all parts of the world and aggregates from hamlets to the global level this volume shows that populations grow or decline according to six related patterns Looking at the path taken by unrestricted population growth the effects of limited resources demographic disaster population explosion and the implications of stable population theory and demographic transition for numerical trends Harris reinterprets and insightfully interconnects all of these via six related growth curves opening the way for a better understanding of how populations expand through changes in births deaths and migrations and how they interact with their economic social and physical environments All six trend types the book shows are shaped by forces internal to the dynamics of populations themselves Most frequently they increase in a constantly proportionally slowing curve as a specific stimulus is spent through expansion With shocks like war or epidemics they contract according to an upside down version of this curve The only two curves until recent times these are still the most common in local populations With modern economic and social change some populations mostly larger ones follow one of four newer growth patterns either increasing at a steady rate growing in a gradually slowing pattern between this constancy and the rapidly decelerating basic growth curve exploding in an accelerating fashion or in a few ominous cases decreasing in an accelerating decline Where these curves occur depends on the distinctive ways populations interact with economic changes Harris s findings have profound implications for understanding economic and social change These implications will be discussed in the following volume The Evolution and History of Human Populations in South Asia Michael D.

Petraglia, Bridget Allchin, 2007-05-22 This is the first volume of its kind on prehistoric cultures of South Asia The book brings together archaeologists biological anthropologists geneticists and linguists in order to provide a comprehensive account of the history and evolution of human populations residing in the subcontinent New theories and methodologies presented provide new interpretations about the cultural history and evolution of populations in South Asia **Energy and Water**

Humans as Components of Ecosystems Mark J. McDonnell, Steward T.A. Pickett, 2012-12-06 This book a product of the fourth Cary Conference amply demonstrates the achievement of a major goal of all Cary Conferences That is Cary Conferences were conceived to provide a forum for comprehensive discussion of major ecological issues from more philosophical and comprehensive perspectives The Institute of Ecosystem Studies is proud to make its staff and facilities available on a biennial basis for the purpose of initiating and fostering these important discussions On the one hand the influence of humans on ecosystems may be quite obvious such as when a forest is cut On the other humans live within and among ecosystems but ecologists largely have avoided making detailed and rigorous analyses of the more subtle effects that human activities generate Indeed most ecologists have sought out rather pristine or remote areas for study rather than those which include humans This book brings together a stimulating mix of disciplines to highlight and evaluate these problems as well as the opportunities of including humans as integral components in studies of natural ecosystems An exciting dialogue has ensued Hopefully this book will convey some of the excitement and challenges that were generated at this Cary Conference
